Artificial Selection in *Brassica*, Part I

adapted as a laboratory exercise developed by Professor Bruce Felt, University of Minnesota

I. Objectives

1. Gain familiarity with the process of artificial selection.
2. Gain familiarity with some plant varieties in the genus *Brassica* that are the products of artificial selection.
3. Conduct an artificial selection experiment involving two cultivars of *Brassica* rape in which you will
 - a. quantify the variability of a specific trait in the first generation of the two cultivars,
 - b. attempt to change the genetic makeup of the next generation with respect to this trait so that, on average, the next generation exhibits the trait to a substantially greater degree than the initial generation, and
 - c. compare the performance between the two cultivars with respect to the expression of the trait to determine if an upper limit has been reached in the expression of the trait.

II. Introduction

A visit to a farm, supermarket, pet store or plant nursery will offer many examples of selective breeding of plants and animals by humans. Over hundreds and even thousands of years, humans have altered various species of plants and animals for our own use by selecting individuals for breeding that possessed certain desirable traits. This selective breeding process was continued for generation after generation. Often the products of such selective breeding are remarkable. Quite diverse domestic dog breeds, from chihuahuas and miniature poodles to Newfoundlands and Irish wolfhounds are all related to a common wild ancestor, the wolf (*Canis lupus*). Domestic chickens are all derived from the wild Jungle Fowl (*Gallus gallus*).

The success of plant and animal breeders in dramatically changing the appearance of various lineages of organisms in a relatively short period of time is an obvious yet profound fact. This fact did not escape Charles Darwin as the first chapter of *The Origin of Species* concerns artificial selection by humans ("Variation under Domestication"). Darwin used many examples of artificial selection by humans to help support the case for his proposed mechanism for the evolution of natural populations – natural selection. For example, Darwin was particularly taken with the number of pigeon varieties such as rockpigeons, postons, fantails and many others. All of these pigeon varieties were derived from wild Rock Doves (*Columba livia*) over the past 5,000 years. One can find similar examples of selective breeding among plants, including those humans have bred for food.

To gain a better understanding of selection and inheritance, biologists have experimented with artificial selection involving a variety of traits in many different species of bacteria, yeast, plants and animals. The results, obtained in a relatively short period of time, are often impressive.
