

Punnett Square

A Punnett square is used to predict the possible genotypes of offspring from certain parents. In a Punnett square, the alleles for one parent are written along the top of the square. The alleles for the other parent are written along the side of the square. The possible genotypes of the offspring are found by combining the letters at the top and side of each square.

EPB condition students were told that winning in the game was a probabilistic outcome dependent on a combination of chance and skill on the part of the students. In the Control condition students were told that winning in the game was a deterministic outcome dependent on students skill only. Students played the game during two class periods. Measures include pre and posttests, motivational survey measures, and in game behaviors. The EPB did have an effect on learning but only amongst high failing students. High failing EPB students learned just as much as their low failing counterparts. This was not so in the Control condition where high failing students learned far less than their low failing counterparts. So the high failing EPB group was behaving as if they were buffered from the effects of failure. We also found evidence of a possible mechanism behind this learning effect. In the high failing EPB condition students were equally likely to persist after success and failure while in the Control condition students were far more likely to persist after success exhibiting risk averse behaviors. This difference was more exaggerated in a within subjects comparison contrasting the same individuals in situations of high and low failure. Finally persistence after failure was associated with learning across the full sample of subjects. Regardless of condition or failure rate students who persisted more after failure also learned more. This study together with the author's related body of work provides compelling evidence that an EPB is a viable intervention for encouraging persistence in the face of failure.
