1. The following pairs of letters represent alleles of different genotypes. Indicate which pairs are Heterozygous and which are Homozygous. Also indicate whether the homozygous pairs are Dominant or Recessive (*note heterozygous pairs don't need either dominant nor recessive labels.)

A. BB = Homozygous dominantD. gg = Homozygous recessiveB. Bb = HeterozygousE. aa = Homozygous recessiveC. Gg = HeterozygousF. Ee = Heterozygous

2. In humans, brown eye color (B), is dominant over blue eye color (b). What are the phenotypes of the following genotypes?

A. Bb = Brown eyesB. BB = Brown eyesC. bb = blue eyesMonohybrid Crosses with Complete Dominance

3. A heterozygous smooth pea pod plant is crossed with a wrinkled pea pod plant. There are two alleles for pea pod, smooth and wrinkled. Use R for seed texture. Predict the offspring from this cross.

a. What is the genotype of the parents? Rr x rr

b. Set up a Punnett square with possible gametes.

	R	r
r	Rr	rr
r	Rr	rr

c. Fill in the Punnett square for the resultant offspring.

d. What is the predicted genotypic ratio for the offspring? 1Rr : 1rre. What is the predicted phenotypic ratio for the offspring? 1 smooth : 1 wrinkledf. If this cross produced 50 seeds how many would you predict to have a wrinkled pod? 25

4. In humans, achondroplasia "dwarfism" (D) is dominant over normal (d).

A homozygous dominant (DD) person dies before the age of one.

A heterozygous (Dd) person is dwarfed. A homozygous recessive individual is normal.

A heterozygous dwarf man marries a heterozygous dwarf woman...

	D	d
D	DD	Dd
d	Dd	dd

a. What is the probability of having a normal child? 1/3... 33.3%b. What is the probability that the next child will also be normal? 1/3... 33.3%

each child is a new shot at the same punnett square!

c. What is the probability of having a child that is a dwarf? 2/3... 66.6%d. What is the probability of having a child that dies at one from this disorder? 25%

Characteristic clinical immune phenotypes and molecular mechanisms associated with inflammatory diseases, 2nd edition Chengjin Gao, Shuming Pan, Kun Xiong, 2024-11-06 The systemic inflammatory response is evident in inflammatory diseases and the immune system secretes many cytokines involved resulting in a robust immune response For example the pathogenesis of sepsis includes abnormal immune cell activation in the early stages as well as sepsis related immunosuppression During the immunosuppressive phase CD4 T cells CD8 T cells Th17 cells and d T cells are reduced while regulatory T cells increase At the same time T lymphocytes and neutrophils as immune effector cells interact with each other and play a key role in regulating the immune response to immune inflammatory diseases The increased release of neutrophil extracellular trap networks NETs by neutrophils leads to a significant upregulation of NETs DNA MPO which further aggravates the septic inflammatory response and organ functional impairment Therefore it is important to deeply investigate the characteristic clinical immune phenotypes and molecular mechanisms associated with inflammatory diseases and targeting therapies against them may provide new ideas for the precise treatment of diseases The goal of this Research Topic is to provide a forum to advance research on the contribution of the fundamental mechanisms of immune system development and function with special emphasis on the description and mechanism of clinical immunological phenotypes in different immune disorders and the definition of their molecular basis The Research Topic had the bullet points including but not limited to the following

- 1 Description of the immune phenotypes of various common acute and chronic diseases
- 2 The regulatory mechanisms of different factors on the development and function of the host immune system
- 3 Inflammatory immunological mechanisms organ function and interorgan interactions

Genetic and Epigenetic Control on Immune Responses Regulating

Molecules in Cancer Development, Progression, and Treatment Katherine Chiappinelli,Alejandro Villagra ,Lidia Karabon,2024-10-16 In line with recent evidence the development of cancer has been described as uncontrolled cell growth that results from gradual accumulation of genetic and epigenetic alterations involving aberrations in oncogenes tumor suppressor genes and defects in genes engaged in DNA repair As a result cancer cells acquire a neoplastic phenotype and tumor associated antigens TAAs are presented on their surface These target structures should be recognized by cells of the immune system However a sequence of events at the genetic and epigenetic level disturb immune cells and in consequence make them unable to eliminate cancer cells Both innate and adaptive immunity are mobilized against cancer cells In response to the appearance of cells with malignant transformation NK cells release perforin and granzyme causing direct cytolysis of the target cells They can also secrete pro inflammatory cytokines and in that way enhance the anticancer response The activity of NK cells is regulated by a variety of activating and inhibitory receptors including NKG2D KIR CD94 NKG2 heterodimers and natural cytotoxicity receptors TNF family ligands as well as co stimulatory receptors which recognize related molecules on target cells A fundamental trigger of the anticancer immune response is the recognition of TAAs by T cells via the major histocompatibility complex MHC which should be followed by signals from co stimulatory molecules Full activation of T lymphocytes requires a third signal provided by the presence of cytokines and this leads to cell proliferation differentiation and secretion of chemokines and cytokines The effect is to drive the clonal expansion of the T cells directed against TAAs and to recruit other immune effector cells in order to enhance immune defense

Translational Medicine in the Diagnosis and Treatment of Cancer based on Oncogenetics: From Bench to Bedside Changjing Cai,Rui Cao,Jiao Hu,Ying Han,Changsheng Xing,2023-12-07

Translational medicine was first mentioned in 1992 by Choi D W and has since become a rapidly expanding area within biomedical research It is based on the bench to bedside approach which describes its relationship between basic science and clinical practice In 2008 Drs Conway and Dougherty provided a 3 step process to translational medicine and how it should be implemented to transform healthcare systems The first step is the translation of basic science into clinical research T1 The second step T2 focuses on making healthcare more patient specific basing itself on providing the right treatment for the right patient in the right way at the right time T2 also looks for this science to be translated into practice guidelines for clinicians policy makers and the patients themselves The final step T3 addresses the how of implementing these ideas so that high quality healthcare can be delivered reliably to all patients in all settings of care T3 activities would include policy changes that could serve to bring about meaningful change towards this goal Cancer is a major public health problem worldwide Clarifying the etiology and pathogenesis of cancer is of great significance to the prevention diagnosis and treatment of the disease The bench to bedside pattern can be a useful method for cancer related studies This Research Topic aims to highlight the emerging role of oncogenetics in cancer and discuss potential challenges of diagnosis and treatment from the bench to the bedside
