Oliveira, Jorge R. Fernandes, Igor M. Filanovsky, Chris J. M. Verhoeven, Manuel M. Silva, 2008-07-08 Modern RF receivers and transmitters require quadrature oscillators with accurate quadrature and low phase noise Existing literature is dedicated mainly to single oscillators and is strongly biased towards LC oscillators This book is devoted to quadrature oscillators and presents a detailed comparative study of LC and RC oscillators both at architectural and at circuit levels It is shown that in cross coupled RC oscillators both the quadrature error and phase noise are reduced whereas in LC oscillators the coupling decreases the quadrature error but increases the phase noise Thus quadrature RC oscillators can be a practical alternative to LC oscillators especially when area and cost are to be minimized The main topics of the book are cross coupled LC quasi sinusoidal oscillators cross coupled RC relaxation oscillators a quadrature RC oscillator mixer and an integrator oscillators The effect of mismatches on the phase error and the phase noise are thoroughly investigated The book includes many experimental results obtained from different integrated circuit prototypes in the GHz range A structured design approach is followed a technology independent study with ideal blocks is performed initially and then the circuit level design is addressed This book can be used in advanced courses on RF circuit design In addition to post graduate students and lecturers this book will be of interest to design engineers and researchers in this area Design of Very High-Frequency Multirate Switched-Capacitor Circuits Seng-Pan U, Rui Paulo Martins, José Epifânio da Franca, 2006 Design of Very High Frequency Multirate Switched Capacitor Circuits

presents the theory and the corresponding CMOS implementation of the novel multirate sampled data analog interpolation technique which has its great potential on very high frequency analog front end filtering due to its inherent dual advantage of reducing the speed of data converters and DSP core together with the specification relaxation of the post continuous time filtering. This technique completely eliminates the traditional phenomenon of sampled and hold frequency shaping at the lower input sampling rate. Also in order to tackle physical IC imperfections at very high frequency the state of the art circuit design and layout techniques for high speed Switched Capacitor SC circuits are comprehensively discussed. Optimum circuit architecture tradeoff analysis. Simple speed and power trade off analysis of active elements. High order filtering response accuracy with respect to capacitor ratio mismatches. Time interleaved effect with respect to gain and offset mismatch. Time interleaved effect with respect to timing skew and random jitter with non uniformly holding. Stage noise analysis and allocation scheme. Substrate and supply noise reduction. Gain and offset compensation techniques. High bandwidth low power amplifier design and layout. Very low timing skew multiphase generation. Two tailor made optimum design examples in CMOS are presented. The first one achieves a 3 stage 8 fold SC interpolating filter with 5.5MHz bandwidth and 108MHz output sampling rate for a NTSC PAL CCIR 601 digital video at 3 V. Another is a 15 tap 57MHz SC FIR bandpass interpolating filter with 4 fold sampling rate increase to 320MHz and the first time embedded frequency band up translation for DDFS system at 2.5V. The corresponding chip prototype achieves so far the highest operating frequency, highest filter order and highest center frequency with highest dynamic range under the lowest supply voltage when compared to the previously reported high frequency SC filters in CMOS.
