Essential Pathways and Circuits of Autism Pathogenesis Gül Dölen, Mustafa Sahin, 2016-08-15 The Centers for Disease Control and Prevention estimate that 1 in 68 children in the United States is afflicted with autism spectrum disorders ASD yet at this time there is no cure for the disease Autism is characterized by delays in the development of many basic skills most notably the ability to socialize and adapt to novelty The condition is typically identified in children around 3 years of age however the high heritability of autism suggests that the disease process begins at conception The identification of over 500 ASD risk genes has enabled the molecular genetic dissection of the pathogenesis of the disease in model organisms such as mice Despite the genetic heterogeneity of ASD etiology converging evidence suggests that these disparate genetic lesions may result in the disruption of a limited number of key biochemical pathways or circuits Classification of patients into groups by pathogenic rather than etiological categories will likely aid future therapeutic development and clinical trials In this set of papers we explore the existing evidence supporting this view Specifically we focus on biochemical cascades such as mTOR and ERK signaling the mRNA network bound by FMRP and UBE3A dorsal and ventral striatal circuits cerebellar circuits hypothalamic projections as well as prefrontal and anterior cingulate cortical circuits Special attention will be given to studies that demonstrate the necessity and/or sufficiency of genetic disruptions e.g. by molecular deletion and/or replacement in these pathways and circuits for producing characteristic behavioral features of autism Necessarily these papers will be heavily weighted towards basic mechanisms elucidated in animal models but may also include investigations in patients

**The Myth of the Spoiled Child** Alfie Kohn, 2016-03-08 A prominent and esteemed critic challenges widely held beliefs about children and parenting revealing that underlying each myth is a deeply conservative ideology that is ironically often adopted by liberal parents Somehow a set of deeply conservative assumptions about children what they're like and how they should be raised has congealed into the conventional wisdom in our society Parents are accused of being both permissive and overprotective unwilling to set limits and afraid to let their kids fail Alfie Kohn systematically debunks these beliefs not only challenging erroneous factual claims but also exposing the troubling ideology that underlies them Complaints about pushover parents and coddled kids are hardly new he shows and there is no evidence that either phenomenon is especially widespread today let alone more common than in previous generations Moreover new research reveals that helicopter parenting is quite rare and surprisingly may do more good than harm when it does occur The major threat to healthy child development Kohn

argues is parenting that is too controlling rather than too indulgent With the same lively contrarian style that marked his influential books about rewards competition and education Kohn relies on a vast collection of social science data as well as on logic and humor to challenge assertions that appear with numbing regularity in the popular press and are often accepted uncritically even by people who are politically liberal These include claims that young people suffer from inflated self esteem are entitled and narcissistic receive trophies praise and A s too easily are in need of more self discipline and grit Kohn s invitation to reexamine these and other assumptions is particularly timely his book has the potential to change our culture s conversation about kids and the people who raise them

**Dynamics of cyclic nucleotide signaling in neurons** Pierre Vincent, Nicholas C. Spitzer, 2015-09-16 Cyclic nucleotides control a number of neuronal properties including neuronal differentiation pathfinding regulation of excitability and synaptic transmission and control of gene expression Signaling events mediated by cAMP or cGMP are transient and take place within the complex 3 dimensional structure of the neuronal cell Signaling events happen on the time scale of seconds to minutes and the biological significance of the temporal dimension remains poorly understood Structural features of neurons dendritic spines and branches cell body nucleus axon as well as AKAPs and other scaffolding proteins that keep signaling enzymes together and form signaling microdomains are critical spatial determinants of signal integration Finally the types of enzymes involved in signal integration which are expressed as a number of different types and splice variants yield another dimension that determines signal integration properties Biosensor imaging provides direct temporal and spatial measurement of intracellular signals This novel approach together with more conventional methods such as biochemistry electrophysiology and modeling now provide a better understanding of the spatial and temporal features of cyclic nucleotide signal integration in living neurons This topic aims at providing a better understanding of how neurons are making sense of cyclic nucleotide signaling in living neurons

**Neural circuits underlying emotion and motivation: Insights from optogenetics and pharmacogenetics** Anton Ilango, Mary Kay Lobo,2015-06-04 Application of optogenetic and pharmacogenetic tools to study the neural circuits underlying emotional valence feeding arousal and motivated behaviors has provided crucial insights into brain function Expression of light sensitive proteins into specific neurons and subsequent stimulation by light optogenetics to control neuronal activity or expression of designer receptors exclusively activated by designer drugs DREADDs in specific neuronal populations with subsequent activation or suppression of neuronal activity by an otherwise inert ligand pharmacogenetics provides control over defined elements of neural circuits These novel tools have provided a more in depth understanding into several questions about brain function These include Regulation of sleep wake transition by the interaction of hypocretin neurons of lateral hypothalamus and noradrenergic neurons of the locus coeruleus Regulation of feeding by AgRP and POMC neurons

in arcuate nucleus of the hypothalamus Place preference and positive reinforcement by activation of DA neuron of VTA Place aversion by activation of VTA GABA and lateral habenula neurons Opposing influences on reinforcement by activation of D1 and D2 expressing medium spiny neurons of dorsal striatum and nucleus accumbens The list still grows From cell type specific manipulations to signaling properties in the cell Dietz et al 2012 with unprecedented temporal resolution these tools revolutionize the exploration of pathways connectivity Recent years also witnessed the extension of applying these tools from studying emotional valence and motivated behavior to reactivation of memory c fos based genetic approaches allowed us to integrate light sensitive opsins or DREADD receptor into specific neurons that are activated by certain learning events for example fear Garner et al 2012 Liu et al 2012 In this Research Topic we welcome researchers to contribute original research articles review articles methods and commentary on topics utilizing optogenetic and pharmacogenetic tools to study the neural circuits underlying emotional valence motivation reinforcement and memory We believe the Research Topic will shine light on various questions we have about brain function by using novel optogenetic and pharmacogenetic tools and will hopefully inspire ongoing research to overcome the hurdles of using these tools to advance clinical applications
