DARWIN & NATURAL SELECTION

Name: _____

Charles Darwin was a naturalist, which is a term used to describe someone who is fascinated by and interested in studying nature. Perhaps you are a naturalist too! How would you ever notice the different kinds of bugs in your backyard or paid attention to the qualities of grass in different fields? If so, you'd find a friend in Darwin.

Darwin was only 22 years old when he was born of imaginations as they traveled around British naval vessel called the HMS Beagle primarily invited to keep the captain company. It was at the chance to travel to distant lands, rocks, plants, and animals.

On board, Darwin experienced terrible seasickness, but he recorded everything he saw and back to experts. Their journey lasted nearly to some conclusions that led to his legacy of all time.

Darwin's Observations

Throughout his journey, Darwin made some developing his famous theory. He called it "the Theory of Evolution."

Darwin's most famous observations...are the West coast of South America called the Galapagos islands from the coast of Ecuador, or anywhere else in the world.

Darwin's Conclusions

Darwin noted that characteristics on each island were suited for the food available on the island. Species survive in a particular environment.

Beaks. Bird who drank nectar had thin, long beaks.

Based on these observations, Darwin developed his ideas about a mechanism by which evolution could occur: **natural selection**. Natural selection is the process by which individuals who are best suited to their environment survive, reproduce, and pass on their traits to the next generation. Through this process, the best traits spread and become more common in a population, while less useful traits are eventually eliminated.

Darwin's Prior Knowledge

In order to develop his ideas about evolution, Darwin had already known:

1. **Hereditary Traits**

1. Darwin's theory is sometimes called "descent with modification." What does "descent" mean? "Modification" mean?

2. Darwin did not call his theory "evolution." Why do you think he called it "descent with modification"?

5. Explain why a characteristic which helps an organism survive in one environment can become a disadvantage in another environment.

Before his visit to the Galapagos, Darwin would have taken it for granted that the different kinds of finches he saw on his journey were each created specifically by God. Using the plants he found on his travels and his prior knowledge, Darwin could have concluded that these finches were all descendants of one common ancestor.

Following this same logic, Darwin suggested that all species must share common ancestors. The more similar two species are, the more recent their ancestor is likely to be. But even quite dissimilar species came from the same ancestor who lived millions of years ago.

Despite his convictions about his work, Darwin did not share his controversial ideas with the public until he was 73. Another naturalist, Alfred Wallace, approached Darwin about his work. Wallace had come to the same conclusions about evolution and natural selection in a recent trip to the Pacific Islands. Together Wallace and Darwin both published books describing their findings, paving the way for modern genetics and biology.

DARWIN & NATURAL SELECTION

Name: _____

In each of the following scenarios, identify the parts of Darwin's theory.

1. A hawk eats a mouse. The mouse is a species of mouse. As winter approaches, the hawk eats the mouse because the mouse is fat. The hawk's predators are birds who hunt for the mouse when the mouse is fat.

Which trait is favorable? Why?

How does this species overproduce?

How will this species change over time?

2. Only 1 out of 1000 sea turtles survives to adulthood. From the moment they hatch, sea turtles must compete for survival. They race across the beach and battle the waves, competing for food. Throughout this time, predators are stalking them for an easy meal. Some sea turtles are faster than others.

Which trait is favorable? Why?

How does this species overproduce?

How will this species change over time?

3. Storks are a species of bird that only has the time and energy to provide for one chick. Storks lay two eggs. After the eggs hatch, the birds feed both chicks for a week. After a week's time, the storks focus only on the larger chick. The smaller chick is left to fend for itself. From then, the parents focus their efforts only on the larger chick.

Which trait is favorable? Why?

How does this species overproduce?

How will this species change over time?

The Battle of Beginnings Del Ratzsch, 2010-02-28 Voted one of Christianity Today's 1997 Books of the Year
Creation versus evolution The debate is growing louder and hotter whether in lecture halls or in between the pages of bestselling books But neither side seems to be winning Why In The Battle of Beginnings Del Ratzsch examines the history of the debate and critiques the entrenched positions that he argues merely impede progress toward the truth Dissatisfied with both creationist fallacies and materialist misconstruals he seeks to lay the groundwork for more fruitful dialogue In considerable detail Ratzsch looks at the history and development of Darwin's theory and common creationist misunderstandings of evolution He then moves on to examine the history and development of creationist theory and pervasive evolutionist misunderstandings of it He also discusses the nature of science and common creationist and evolutionist abuses as a prelude to showing why both sides have remained critical of theistic evolution Above all Ratzsch argues that until philosophical confusion logical missteps and various other snarls have been untangled little real progress can be made in sorting out competing theories of life and its origin With this book he challenges and equips all of us to think more clearly GATE Question Bank - Ecology & Evolution Mocktime Publication, 2400 MCQs GATE Ecology Evolution Chapterwise Question Bank Based on New Syllabus
