Geometric Algebra Applications Vol. II Eduardo Bayro-Corrochano, 2020-06-19 This book presents a unified mathematical treatment of diverse problems in the general domain of robotics and associated fields using Clifford or geometric algebra. By addressing a wide spectrum of problems in a common language it offers both fresh insights and new solutions that are useful to scientists and engineers working in areas related with robotics. It introduces non specialists to Clifford and geometric algebra and provides examples to help readers learn how to compute using geometric entities and geometric formulations. It also includes an in depth study of applications of Lie group theory Lie algebra spinors and versors and the algebra of incidence using the universal geometric algebra generated by reciprocal null cones. Featuring a detailed study of kinematics differential kinematics and dynamics using geometric algebra the book also develops Euler Lagrange and Hamiltonian equations for dynamics using conformal geometric algebra and the recursive Newton Euler using screw theory in the motor algebra framework. Further it comprehensively explores robot modeling and nonlinear controllers and discusses several applications in computer vision graphics neurocomputing quantum computing robotics and control engineering using the geometric algebra framework. The book also includes over 200 exercises and tips for the development of future computer software packages for extensive calculations in geometric algebra and an entire section focusing on how to write the subroutines in C Matlab and Maple to carry out efficient geometric computations in the geometric algebra framework. Lastly it shows how program code can be optimized for real time computations. An essential resource for applied physicists computer scientists AI researchers roboticists and mechanical and electrical engineers the book clarifies and demonstrates the importance of geometric computing for building autonomous systems to advance cognitive systems research.
