Review of Thoracic Imaging

WORD WIZARD

Complete the following paragraph by writing the correct term(s) in the spaces provided. You have been provided with part of the word to help you on your way.

The chest x-ray, or as it is more commonly called, a chest film or x-ray, is one of the most common methods for evaluating the lungs and other structures in the thorax. Air-filled lung tissue appears mostly dark on the film because it is easily penetrated by x-rays. We describe this effect by saying the tissue is radiolucent. The dense bone tissue of ribs appears white. Dense matter that is not easily penetrated is referred to as radiopaque. Fat is dense so it appears whiter than air or tissues. A female patient's breast tissue will alter the appearance of film. Obesity has the same effect. Soft tissues such as blood vessels appear more grayish because they have an intermediate density.

Abnormal conditions may be spotted through observation of certain densities in the wrong location. Accumulation of fluid in the pleural space, or pneumothorax, appears white and may obscure the angle where the ribs meet the diaphragm. If pus collects in the pleura, we call it empyema. Alveoli appear white when filled with pus or blood. On the chest film these white areas are called pulmonary effusion. If alveoli are filled with fluid but the airways around them are open, you will see air bronchograms that may indicate pneumonia. Air in the pleural space, or a pneumothorax, is another example of an abnormal density. This condition appears as a black area with none of the usual grayish markings of blood vessels in the lung tissue.

OVERVIEW

1. Describe the four tissue densities you can see on a chest radiograph.

- Air: Air, stomach, or intestines absorb very few x-rays appearing virtually black
- Fat: Fat absorbs a small amount and appears light gray
- Tissue: Tissue absorbs slightly more and appears medium gray
- Bone: Bone absorbs the most rays and appears white
