- 60 At higher altitude the external pressure is less. As the air in the tyre expands on heating (due to friction with the road surface), the internal pressure increases.
- 61 (a) Particles are in constant random motion and collide with each other and with the walls of the container in perfectly elastic collisions. The kinetic energy of the particles increases with temperature. There are no inter-particle forces and the volume of the particles is negligible relative to the volume of the gas.
- (b) At low temperature, the particles have lower kinetic energy, which favours the formation of inter-particle forces and reduces gas pressure. $\frac{PV}{nRT} < 1$

- In cold climates, temperature may approach or go below the boiling point of butane so the butane stays liquid even when it is released from the pressure it is under when stored in its canister. This makes it ineffective as a fuel.

- Many reactions with "useless" by-products could have high stoichiometric yield under optimum conditions, but low atom economy, for example, methanoic acid production:
 $2\text{NaCOOH} + \text{H}_2\text{SO}_4 \rightarrow 2\text{HCOOH} + \text{Na}_2\text{SO}_4$
 For 100% conversion with stoichiometric reactants, the yield = 100%.

- As NaOH dissolves, the separated Na^+ and OH^- ions become hydrated, i.e. they are surrounded by H_2O molecules. This involves breaking the hydrogen bonds between the H_2O molecules in pure water and allows closer packing, which reduces the volume.

Chemistry in Action: Making Molecular Movies with Ultrafast Electron Diffraction and Data Science Lai Chung Liu,2020-09-10 The thesis provides the necessary experimental and analytical tools to unambiguously observe the atomically resolved chemical reactions A great challenge of modern science has been to directly observe atomic motions during structural transitions and while this was first achieved through a major advance in electron source brightness the information content was still limited and new methods for image reconstruction using femtosecond electron diffraction methods were needed One particular challenge lay in reconciling the innumerable possible nuclear configurations with the observation of chemical reaction mechanisms that reproducibly give the same kind of chemistry for large classes of molecules The author shows that there is a simple solution that occurs during barrier crossing in which the highly anharmonic potential at that point in nuclear rearrangements couples high and low frequency vibrational modes to give highly localized nuclear motions reducing hundreds of potential degrees of freedom to just a few key modes Specific examples are given in this thesis including two photoinduced phase transitions in an organic system a ring closure reaction and two direct observations of nuclear reorganization driven by spin transitions The emerging field of structural dynamics promises to change the way we think about the physics of chemistry and this thesis provides tools to make it happen
