Account Xtream Paper 2013:

Extremist Islam Kumar Ramakrishna, 2022 Since the Bali terrorist attacks in 2002 law enforcement agencies have rigorously combatted terrorist networks in Southeast Asia yet groups motivated by violent extremist interpretations of Islam remain resilient and dangerous This book shines a light on specific beliefs behaviors and policies that impact these challenges ultimately offering cutting edge effective tools for response The book begins by challenging misguided and controversial notions that depict Islam as an inherently violent religion arguing that the theological ideological amalgam of what has been called Salafabism is the more useful lens for recognizing closed minded extremist currents The book carefully distinguishes this Salafabist extremist mindset from relatively open minded Salafabist radicalism paying due attention to nonviolent extremists and the ways they can contribute to rather than reduce violent terrorist activity in the region Using poignant case studies from Malaysia Singapore the Philippines and Indonesia the book clarifies a bewildering range of terminology associated with Islamist violence and explains how imprecise and oversimplified narratives are destructive to progress and worse empowering to terrorist organizations These chapters build up to research informed policies and rhetorical recommendations for improved outcomes With its novel insights into the root causes of extremist terrorism in Southeast Asia the ineffective policies that prohibit progress and promote unrest in this region and the avenues for positive change this book offers a comprehensive strategy for fostering theologically sound yet culturally authentic counterterrorist measures that defend the complex richly textured tapestry of culture in Southeast Asia

Modularity in Motor Control: From Muscle Synergies to Cognitive Action Representation Andrea d'Avella, Martin Giese, Yuri P Ivanenko, Thomas Schack, Tamar Flash, 2016-04-21 Mastering a rich repertoire of motor behaviors as humans and other animals do is a surprising and still poorly understood outcome of evolution development and learning Many degrees of freedom non linear dynamics and sensory delays provide formidable challenges for controlling even simple actions Modularity as a functional element both structural and computational of a control architecture might be the key organizational principle that the central nervous system employs for achieving versatility and adaptability in motor control Recent investigations of muscle synergies motor primitives compositionality basic action concepts and related work in machine learning have contributed to advance at different levels our understanding of the modular architecture underlying rich motor behaviors However the existence and nature of the modules in the control architecture is far from settled For instance regularity and low dimensionality in the motor output are often taken as an indication of modularity but could they simply be a byproduct of optimization and task constraints Moreover what are the relationships between modules at different levels such as muscle synergies kinematic invariants and basic action concepts

One important reason for the new interest in understanding modularity in motor control from different viewpoints is the impressive development in cognitive robotics. In comparison to animals and humans the motor skills of today's best robots are limited and inflexible. However, robot technology is maturing to the point at which it can start approximating a reasonable spectrum of isolated perceptual, cognitive and motor capabilities. These advances allow researchers to explore how these motor, sensory and cognitive functions might be integrated into meaningful architectures and to test their functional limits. Such systems provide a new test bed to explore different concepts of modularity and to address the interaction between motor and cognitive processes experimentally. Thus the goal of this Research Topic is to review, compare and debate theoretical and experimental investigations of the modular organization of the motor control system at different levels. By bringing together researchers seeking to understand the building blocks for coordinating many muscles for planning endpoint and joint trajectories and for representing motor and behavioral actions in memory, we aim at promoting new interactions between often disconnected research areas and approaches and at providing a broad perspective on the idea of modularity in motor control. We welcome original research, methodological, theoretical review and perspective contributions from behavioral, system and computational motor neuroscience, research, cognitive psychology and cognitive robotics.

Science of Weather, Climate and Ocean Extremes John E. Hay, 2022-11-27 Science of Weather, Climate and Ocean Extremes presents an evidence-based view of the most important ways in which the build-up of greenhouse gases in the atmosphere is affecting both our atmosphere and the oceans. The book provides compelling reasons why concerted action is required to slow the rate at which the atmosphere and oceans are changing. It not only covers longer-term changes in extremes and their causes but also considers the drivers and attribution of extreme events including relevant methods and techniques. Members of the Royal Meteorological Society are eligible for a 35% discount on all Developments in Weather and Climate Science series titles. See the RMetS member dashboard for the discount code. Provides an evidence-based understanding of a significant risk to the future performance of human and natural systems. Includes assessments, advice and recommendations of extreme weather and climate events. Features case studies from around the globe to provide further context to the research.
