Trading at the Speed of Light tells the story of how many of our most important financial markets have transformed from physical trading floors on which human beings trade face to face into electronic systems within which computer algorithms trade with each other Tracing the emergence of ultrafast automated high frequency trading HFT since the early 2000s Donald MacKenzie draws particular attention to the importance of what he deems the material political economy of twenty first century finance Fast transmission of price data used to involve fibre optic cables but the strands in such cables are made of materials usually a specialised form of glass

which slow light down to around two thirds of its speed in free space By contrast microwave and other wireless signals used in HFT travel through the atmosphere at nearly full light speed At these nanosecond speeds the physical nature of information transmission and the precise spatial location of the equipment involved become hugely important thus creating inevitable pinch points in the system MacKenzie details the ways in which these pinch points individual frequency bands specific locations on the roofs of computer data centres and particular sites for microwave towers are especially advantageous making it possible for those who control them to profit from that control The book draws from over 300 interviews conducted with high frequency traders around the world the people who supply them with technological systems and communication links exchange staff and regulators as well as with others who function within markets that have not yet become dominated by HFT MacKenzie focuses most closely upon the four main sites of international HFT Chicago New York Amsterdam and London and examines both the technology and the politics underpinning modern financial markets
