(A) What is atmosphere ?

Answer: Atmosphere is the thick blanket of air that surrounds the surface of the earth. It is divided into different layers.

(a) Troposphere: It is the first layer of the atmosphere that is just above the surface of the earth. The air that we breathe is present in this layer. This supports life on the earth.

(b) Stratosphere: Above the troposphere lies the stratosphere. It extends up to a height of 50 km. The ozone layer is present in this layer. Airplanes fly in this layer.

(c) Mesosphere: This is the third layer of the atmosphere. It lies above the stratosphere. It extends up to the height of 80 km. Meteorites burn up in this layer on entering from the space.

(d) Thermosphere: In thermosphere temperature rises very rapidly with increasing height. Ionosphere is a part of this. This layer helps in radio transmission.

(e) Exosphere: The upper most layer of the atmosphere is known as exosphere. This layer has very thin air.

Predicting Our Climate Future David Stainforth, 2023-09-12 This book is about how climate science works and why you should absolutely trust some of its conclusions and absolutely distrust others Climate change raises new foundational challenges in science It requires us to question what we know and how we know it The subject is important for society but the science is young and history tells us that scientists can get things wrong before they get them right How then can we judge what information is reliable and what is open to question Stainforth goes to the heart of the climate change problem to answer this question He describes the fundamental characteristics of climate change and shows how they undermine the application of traditional research methods demanding new approaches to both scientific and societal questions He argues for a rethinking of how we go about the study of climate change in the physical sciences the social sciences economics and policy The subject requires nothing less than a restructuring of academic research to enable integration of expertise across diverse disciplines and perspectives An effective global response to climate change relies on us agreeing about the underlying foundational scientific knowledge Our universities and research institutes fail to provide the necessary clarity they fail to separate the robust from the questionable because they do not acknowledge the peculiar and unique challenges of climate prediction Furthermore the widespread availability of computer simulations often leads to research becoming divorced from understanding something that risks undermining the relevance of research conclusions This book takes the reader on a journey through the maths of complexity the physics of climate philosophical questions regarding the origins and robustness of knowledge and the use of natural science in the economics and policy of climate change
