Parallel Processing and Applied Mathematics Roman Wyrzykowski,Jack Dongarra,Norbert Meyer,Jerzy Wasniewski,2006-06-09 This book constitutes the thoroughly refereed post proceedings of the 6th International Conference on Parallel Processing and Applied Mathematics PPAM 2005 The book presents 135 papers organized in topical sections on parallel and distributed architectures parallel and distributed non numerical algorithms performance analysis prediction and optimization grid programming tools and environments for clusters and grids applications of parallel distributed grid computing evolutionary computing with applications parallel data mining parallel numerics and mathematical and computing methods *The Mathematical Gazette* ,1972 **Mathematical Modeling of the Immune System in Homeostasis, Infection and Disease** Gennady Bocharov,Burkhard Ludewig,Andreas Meyerhans,Vitaly Volpert,2020-02-24 The immune system provides the host organism with defense mechanisms against invading pathogens and tumor development and it plays an active role in tissue and organ regeneration Deviations from the normal physiological functioning of the immune system can lead to the development of diseases with various pathologies including autoimmune diseases and cancer Modern research in immunology is characterized by an unprecedented level of detail that has progressed towards viewing the

immune system as numerous components that function together as a whole network. Currently we are facing significant difficulties in analyzing the data being generated from high throughput technologies for understanding immune system dynamics and functions, a problem known as the curse of dimensionality. As the mainstream research in mathematical immunology is based on low resolution models, a fundamental question is how complex the mathematical models should be. To respond to this challenging issue, we advocate a hypothesis driven approach to formulate and apply available mathematical modelling technologies for understanding the complexity of the immune system. Moreover, pure empirical analyses of immune system behavior and the system's response to external perturbations can only produce a static description of the individual components of the immune system and the interactions between them. Shifting our view of the immune system from a static schematic perception to a dynamic multi level system is a daunting task. It requires the development of appropriate mathematical methodologies for the holistic and quantitative analysis of multi level molecular and cellular networks. Their coordinated behavior is dynamically controlled via distributed feedback and feedforward mechanisms which altogether orchestrate immune system functions. The molecular regulatory loops inherent to the immune system that mediate cellular behaviors, e.g. exhaustion, suppression, activation and tuning, can be analyzed using mathematical categories such as multi stability, switches, ultra sensitivity, distributed system, graph dynamics or hierarchical control.
