

DNA Finger Printing

DNA fingerprinting is a method used to determine the probable identity of a person based on the nucleotide sequences of certain regions of human DNA that are unique to individuals.

Like the fingerprints each person has a unique DNA fingerprint.

It is used in a variety of situations, such as criminal investigations, other forensic purposes and paternity testing.

In these situations, one aims to "match" two DNA fingerprints with one another, such as a DNA sample from a known person and one from an unknown person.
