Chapter 9 Gravity Inverse-Square Law and Weight—continued

5. Consider a planet of uniform density that has a straight tunnel from the North Pole through the center to the South Pole. At the surface of the planet, an object weighs 1 ton.

a. Fill in the gravitational force on the object when it is half way to the center, then at the center.

b. Describe the motion you would experience if you fell into the tunnel.

6. Consider an object that weighs 1 ton at the surface of a planet, just before the planet gravitationally collapses. (The mass of the planet remains the same during collapse.)

a. Fill in the weights of the object on the planet's shrinking surface at the radial values shown.

b. When the planet has collapsed to one-tenth of its initial radius, a ladder is erected that puts the object as far from its center as the object was originally. Fill in its weight at this position.

- 1 to provide a balance of quantitative reasoning and conceptual understanding with special attention to concepts that have been causing difficulties to student in understanding the concepts
- 2 to develop students problem solving skills and confidence in a systematic manner
- 3 to motivate students by integrating real world examples that build upon their everyday experiences

Main Features of the Book

- 1 Every concept is up to the mark and it is given in student friendly language with various solved problems The solution is provided with problem solving approach and discussion
- 2 Checkpoint questions have been added to applicable sections of the text to allow students to pause and test their understanding of the concept explored within the current section The answers and solutions to the Checkpoints are given in answer keys at the end of the chapter so that students can confirm their knowledge without jumping too quickly to the provided answer
- 3 Special attention is given to all tricky topics like centripetal and tangential acceleration uniform circular motion vs projectile motion relative angular velocity centripetal and centrifugal force unbanked and banked curves motion in a vertical circle Coriolis force optional effect of rotation of earth on apparent weight and the physics of artificial gravity so that student can easily solve them with fun
- 4 To test the understanding level of students multiple choice questions conceptual questions practice problems with previous years JEE Main and Advanced problems are provided at the end of the whole discussion Number of dots indicates level of problem difficulty Straightforward problems basic level are indicated by single dot intermediate problems JEE mains and NEET level are indicated by double dots whereas challenging problems advanced level are indicated by three dots Answer keys with hints and solutions are provided at the end of the chapter

ASCENT OF MIND Dr. Ahmed Sayeed, Authors Tree Publishing, 2021-04-03 The brain is the most complex organ in the human body It produces our every thought action memory feeling and experience of the world This jelly like mass of tissue

weighing in at around 1.4 kilograms contains a staggering one hundred billion nerve cells or neurons. To be in nutshell it thinks, feels, imagines, emotes, remembers, argues, proposes, theorizes, and for that matter everything that related to one's existence. Without brain, body is nothing but animalist, a super mammal. The complexity of the connectivity between these cells is mind boggling. Each neuron can make contact with thousands or even tens of thousands of others via tiny structures called synapses. Our brains form a million new connections for every second of our lives. The pattern and strength of the connections is constantly changing and no two brains are alike.

Perspectives on Conceptual Change Barbara J. Guzzetti, Cynthia R. Hynd, 2013-12-16. *Perspectives on Conceptual Change* presents case study excerpts illustrating the influence on and processes of students' conceptual change and analyses of these cases from multiple theoretical frameworks. Researchers in reading education have been investigating conceptual change and the effects of students' prior knowledge on their learning for more than a decade. During this time, this research had been changing from the general and cognitive average effects of interventions on groups of students to the specific and personal individuals' reactions to and conceptual change with text structures. Studies in this area have begun to focus on the social, contextual, and affective influences on conceptual change. These studies have potential to be informed by other discourses. Hence, this book shows the results of sharing data in the form of case study excerpts with researchers representing varying perspectives of analyses. Instances of learning are examined from cross-disciplinary views. Case study authors in turn respond to the case analyses. The result is a text that provides multiple insights into understanding the learning process and the conditions that impact learning.

Honoré Fabri and the Concept of Impetus: A Bridge between Conceptual Frameworks Michael Elazar, 2011-05-20. This book discusses the impetus-based physics of the Jesuit natural philosopher and mathematician Honoré Fabri (1608-1688), a senior representative of Jesuit scientists during the period between Galileo's death (1642) and Newton's *Principia* (1687). It shows how Fabri, while remaining loyal to a general Aristotelian outlook, managed to reinterpret the old concept of impetus in such a way as to assimilate into his physics building blocks of modern science like Galileo's law of fall and Descartes' principle of inertia. This account of Fabri's theory is a novel one since his physics is commonly considered as a dogmatic rejection of the New Science, not essentially different from the medieval impetus theory. This book shows how New Science principles were taught in Jesuit Colleges in the 1640s, thus depicting the sophisticated manner in which new ideas were settling within the lion's den of Catholic education.
