Chapter 7: DNA Structure and Replication

Biologically Unique: How DNA helped free an innocent man

Driving Question 1:

What is the function of DNA, and how is DNA organized in cells?

Why should you care?

DNA is the hereditary molecule—passed from parents to offspring—that serves as the instruction manual for “building” each individual. DNA is found in the nucleus of almost every cell in our body. Forensic scientists can, therefore, collect DNA evidence from many different types of crime scene evidence, such as semen, saliva, skin cells, blood, and hair. This DNA can then be used to positively identify a perpetrator or exonerate accused suspects of a crime.

Roy Brown was convicted by junk science; the only “evidence” linking him to the crime was his teeth, and bite mark analysis is notoriously unreliable. Other types of physical evidence, such as hair samples examined under a microscope, are also problematic because they are not distinct enough to positively identify the individual from which they come. DNA is valuable in forensics because it is unique to each individual. DNA’s structure is the key to its uniqueness in each individual.

What should you know?

To fully answer this Driving Question, you should be able to:

1. Describe the origin and function of DNA.
2. Describe the location of DNA in eukaryotic cells.
3. Describe the structure of chromosomes.
4. Describe the number and origin of the chromosomes in human cells.

Infographic Focus:

The infographics most pertinent to the Driving Question are 7.1 and 7.2.

Test Your Vocabulary:

Match these terms to their definitions:

[DEOXYRIBONUCLEIC ACID (DNA)] The molecule of heredity, common to all life forms, that is passed from parents to offspring.

[CHROMOSOME] A single, large DNA molecule wrapped around proteins.

Chromosomes are located in the nuclei of most eukaryotic cells.

[NUCLEOTIDES] The building blocks of DNA. Each nucleotide consists of a sugar, a phosphate, and a base. The sequence of nucleotides (As, Cs, Gs, Ts) along a DNA strand is unique to each person.

1. Describe the origin and function of DNA.

Mathematics for the Life Sciences Erin N. Bodine, Suzanne Lenhart, Louis J. Gross, 2014-08-17 An accessible undergraduate textbook on the essential math concepts used in the life sciences The life sciences deal with a vast array of problems at different spatial temporal and organizational scales The mathematics necessary to describe model and analyze these problems is similarly diverse incorporating quantitative techniques that are rarely taught in standard undergraduate courses This textbook provides an accessible introduction to these critical mathematical concepts linking them to biological observation and theory while also presenting the computational tools needed to address problems not readily investigated using mathematics alone Proven in the classroom and requiring only a background in high school math Mathematics for the Life Sciences doesn't just focus on calculus as do most other textbooks on the subject It covers deterministic methods and those that incorporate uncertainty problems in discrete and continuous time probability graphing and data analysis matrix modeling difference equations differential equations and much more The book uses MATLAB throughout explaining how to use it write code and connect models to data in examples chosen from across the life sciences Provides undergraduate life science students with a succinct overview of major mathematical concepts that are essential for modern biology Covers all the major quantitative concepts that national reports have identified as the ideal components of an entry level course for life science students Provides good background for the MCAT which now includes data based and statistical reasoning Explicitly links data and math modeling Includes end of chapter homework problems end of unit student projects and select answers to

Dickins,2021-11-12 This book is about evolutionary theory It deals with aspects of its history to focus upon explanatory structures at work in the various forms of evolutionary theory as such this is also a work of philosophy Its focus lies on recent debates about the Modern Synthesis and what might be lacking in that synthesis These claims have been most clearly made by those calling for an Extended Evolutionary Synthesis The author argues that the difference between these two positions is the consequence of two things First whether evolution is considered as solely a population level phenomenon or also a theory of form Second the use of information concepts In this book Darwinian evolution is positioned as a general theory of evolution a theory that gave evolution a technical meaning as the statistical outcome of variation competition and inheritance The Modern Synthesis MS within biology has a particular focus a particular architecture to its explanations that renders it a special theory of evolution After providing a history of Darwinian theory and the MS recent claims and exhortations for an Extended Evolutionary Synthesis EES are examined that see the need for the inclusion of non genetic modes of inheritance and also developmental processes Much of this argument is based around claims that the MS adopts a particular view of information that has privileged the gene as an instructional unit in the emergence of form The author analyses the uses of information and claims that neither side of the debate explicitly and formally deals with this concept A more formal view of information is provided which challenges the EES claims about the role of genes in MS explanations of form whilst being consilient with their own interests in developmental biology It is concluded that the MS implicitly assumed this formal view of information whilst using information terms in a colloquial manner In the final chapter the idea that the MS is an informational theory that acts to corral more specific phenomenal accounts is mooted As such the

book argues for a constrained pluralism within biology where the MS describes those constraints **Gender, Class, and Freedom in Modern Political Theory** Nancy J. Hirschmann, 2009-04-11 In *Gender Class and Freedom in Modern Political Theory* Nancy Hirschmann demonstrates not merely that modern theories of freedom are susceptible to gender and class analysis but that they must be analyzed in terms of gender and class in order to be understood at all Through rigorous close readings of major and minor works of Hobbes Locke Rousseau Kant and Mill Hirschmann establishes and examines the gender and class foundations of the modern understanding of freedom Building on a social constructivist model of freedom that she developed in her award winning book *The Subject of Liberty Toward a Feminist Theory of Freedom* she makes in her new book another original and important contribution to political and feminist theory Despite the prominence of state of nature ideas in modern political theory Hirschmann argues theories of freedom actually advance a social constructivist understanding of humanity By rereading human nature in light of this insight Hirschmann uncovers theories of freedom that are both more historically accurate and more relevant to contemporary politics Pigeonholing canonical theorists as proponents of either positive or negative liberty is historically inaccurate she demonstrates because theorists deploy both conceptions of freedom simultaneously throughout their work *The Educational Testing Act of 1981* United States.
