

LAB #01: Introduction: Fundamentals of Programming

Lab Objective:

- a. To learn how to write algorithms in order to solve difficult problems
- b. To learn what does the compiler do
- c. To learn how to write a C++ program
- d. To learn how to take input and how to output data using C++.

Lab Description:

Computer is organized in different units in which the basic units are input, output, memory and CPU. Input unit provide data and instructions to the CPU. Memory stores the data and instructions; CPU executes the instructions and pass the results of the execution to the output.

Algorithm is a well-define and ordered set of instructions which lead to a solution within finite number of steps.

Compiler is a program that translates High-level language to machine language and creates an executable file.

C++ program has one function main () by default without which the program will not execute as the execution starts from the first instruction of the main function.

In C++ taking input from user and printing output on display of computer is done by including a header file in the C++ code called iostream.h which notifies the preprocessor to include the input/output stream contents.

Example:

```
#include <iostream>
using namespace std;

// main() is where program execution begins.
int main() {
    cout << "Hello World"; // prints Hello World
    return 0;
}
```

Let us look at the various parts of the above program –

- The C++ language defines several headers, which contain information that is either necessary or useful to your program. For this program, the header <iostream> is needed. . This contains pre-defined input/output functions that we can use in our program.
- The line using namespace std; tells the compiler to use the std namespace. Namespaces are a relatively recent addition to C++.
