Introductory Physics for the Life Sciences: Mechanics (Volume One) David V. Guerra, 2023-05-09 This textbook provides an accessible introduction to physics for undergraduate students in the life sciences including those majoring in all branches of biology biochemistry and psychology and students working on pre professional programs such as pre medical pre dental and physical therapy The text is geared for the algebra based physics course often named College Physics in the United States The order of topics studied are such that most of the problems in the text can be solved with the methods of Statics or Dynamics That is they require a free body diagram the application of Newton s Laws and any necessary kinematics Constructing the text with a standardized problem solving methodology simplifies this aspect of the course and allows students to focus on the application of physics to the study of biological systems Along the way students apply these techniques to find the tension in a tendon the sedimentation rate of red blood cells in haemoglobin the torques and forces on a bacterium employing a flagellum to propel itself through a viscous fluid and the terminal velocity of a protein moving in a Gel Electrophoresis device This is part one of a two volume set volume 2 introduces students to the conserved quantities and applies these problem solving techniques to topics in Thermodynamics Electrical Circuits Optics and Atomic and Nuclear Physics always with continued focus on biological applications Key Features Organised and centred around analysis techniques not traditional Mechanics and E M Presents a unified approach in a different order meaning that the same laboratories equipment and demonstrations can be used when teaching the course Demonstrates to students that the analysis and concepts they are learning are critical to the understanding of biological systems Introduction to Modeling Biological Cellular Control Systems Weijiu Liu, 2012-04-26 This textbook contains the essential knowledge in modeling simulation analysis and applications in dealing with biological cellular control systems In particular the book shows how to use the law of mass balance and the law of mass action to derive an enzyme kinetic model the Michaelis Menten function or the Hill function how to use a current voltage relation Nernst potential equilibrium equation and Hodgkin and Huxley s models to model an ionic channel or pump and how to use the law of mass balance to integrate these enzyme or channel models into a complete feedback control system The book also illustrates how to use data to estimate parameters in a model how to use MATLAB to solve a model numerically how to do computer simulations and how to provide model predictions Furthermore the book demonstrates how to conduct a stability and sensitivity analysis on a model **College Biology I** James Hall Zimmerman, Sophie E.
