

5. He develops a blood pressure of 80/50. Which statement is most accurate?
 - a. The patient is in cardiogenic shock and should be given meds to increase SVR (systemic vascular resistance). **Wrong**—the first part is correct, but you would never give medications to increase afterload for a patient whose heart is already struggling (cardiogenic = heart-related).
 - b. The patient should be given a negative inotrope, as this will cause vasodilation. **Wrong**—inotrope means related to contractility; a negative inotrope means something that suppresses contractility, not causes vasodilation.
 - c. The patient is hypotensive and should be given large volumes of fluid. **Wrong**—by increasing preload in this case you will add to the heart's workload—the heart "says": 'here I am sick, and now I have more fluid coming in—I have to work even harder!'
 - d. **The patient is in cardiogenic shock and should be given a positive inotrope. Correct**—anything that is a positive inotrope will increase the contractility of the heart, thus giving it the strength to eject more blood and increase the ailing BP.

6. Several days later the patient manifests S&S of heart failure. Given the area of his heart involved in the MI, which are the most likely S&S?
 - a. increased preload & ankle edema. **Wrong**—increased preload (ie, increased blood volume, AKA fluid volume overload,) is usually present in any type of HF; ankle edema is one of S&S of RHF, not left (in stem of question it mentions LV MI).
 - b. decreased afterload & intermittent claudication. **Wrong**—random answers not applying to this situation.
 - c. tricuspid regurgitation & right atrial hypertrophy. **Wrong**—both of these situations occur on right side of heart, not the problem area of our scenario (left side.)
 - d. **shortness of breath and lung crackles. Correct**— you are given the fact that this was an MI in the LV, so most likely, as the LV gets too tired to pump blood forward, some of it will go backward—into the lungs, causing pulmonary edema & related S&S ("Lung crackles" means if you listen to the lungs with a stethoscope, you can hear the crackling of air going in and out of fluid-filled alveoli). **BE SURE TO KNOW HEART FLOW BOTH FORWARD and BACKWARD.**

7. When the patient was suspected of developing the heart failure (HF), lab work was drawn that *specifically* corroborated the diagnosis of HF by showing that the _____ was elevated.
 - a. CRP **Wrong**—likely that a CRP would be elevated, but only indicates that there is inflammation, not where it is.
 - b. **BNP. Correct**— BNP (B-type natriuretic peptide) is secreted by the heart when there is TOO MUCH preload (ie, fluid volume overload)—BNP circulates to the kidneys & "tells them" they need to increase urination as a compensatory response for high blood volume, because a "bad" heart cannot tolerate extra fluid; heart failure should ALWAYS be considered a problem of fluid volume overload because of the effect of the RAAS (see concept map on page 26 of RRD6).
 - c. CK **Wrong**— likely that a CK would be elevated, but only indicates non-specific cell injury (in an MI, both CK AND troponin would be elevated, but CK by itself would not be diagnostic.)
 - d. RBC.

8. A 40-year-old man is undergoing a yearly physical. Everything is fine except that the nurse practitioner hears a murmur. All the following are likely etiologies **EXCEPT**:
 - a. pulmonic valve insufficiency.
 - b. a heart valve that is ischemic from a coronary artery blockage.
 - c. **incompetent venous valves. Correct**— the other answers are appropriate to the scenario; this is the exception, since it is talking about valves in the veins; vein valves don't usually have murmurs that can be heard in this fashion. (Be sure you think about venous valves & heart valves as very different entities)
 - d. a stenotic mitral valve.
