

Biology Exam 1 Study Guide

Lecture 1 → Introduction to Biological Science

Tree of Life

- Domains
 - Eukarya → visible life
 - Split into animals and plants
 - Very small portion
 - Bacteria → single cell
 - Make up most of life's branches
 - Symbionts that evolved into mitochondria and chloroplasts were eubacteria
 - Archaea → original domain of life
 - More closely related to eukaryotes than eubacteria, first branch of life
 - Basic split between archaea and bacteria
- Candidate phyla radiation: Single species have been identified, each identifies an entire phylum which is yet to be understood - pioneer species (tree is dominated by new species that scientists have never seen before)
- Species disappearing faster than can be recovered
- Eukaryotes and archaea are most closely related branches

Destruction and Mass Extinction

- One million species face imminent extinction because of humans
- Recent past → >50% vertebrates/>75% flying insects lost in the past <50 years
- Critically threatened → >40% amphibians, >30% plants/corals/sharks, >25% mammals
- Populations and extinctions have increased

Theory of Evolution

- Evolution: all life on earth evolved from a common ancestor, most properties within cells work in the same way, the change in gene distribution over time within a population
- Theory: a very well substantiated idea that explains many overlapping phenomena at once, wide-ranging, strongest. Not a hypothesis
- Darwin: species arise through random mutation and natural selection for fitness
- Evidence (fewer than 40% of Americans believe in evolution)
 - fossil record shows conservation of homologous structures
 - Molecular proof: same DNA and RNA protein in cells
 - Homologous function in hands and fins → evolved similar mechanisms in appendages
- Scopes Monkey Trial
 - Scopes taught evolution illegally; resulted in Butler Act → forbid teaching evolution in TN
- Endosymbiont theory
 - Single composite cell of greater complexity could evolve from two or more separate simpler living cells in a symbiotic relationship

Year of Earth's History

- 1 Jan: earth formed 4.54 bya by acceleration of material from the solar nebula via gravitational collapse, conditions were incompatible with life, bombarded with asteroid-sized meteors for 800 million years
- 4 Mar: by 3.8 bya bombardment had slowed, Earth had cooled to lower the temps "compatible" with life

Effects of Drought on Forests and Rangelands in the United States James M. Vose, James Samuel Clark, Charles Henry Luce, Toral Patel-Weynand, 2016 This assessment provides input to the reauthorized National Integrated Drought Information System NIDIS and the National Climate Assessment NCA and it establishes the scientific foundation needed to manage for drought resilience and adaptation Focal areas include drought characterization drought impacts on forest processes and disturbances such as insect outbreaks and wildfire and consequences for forest and rangeland values Drought can be a severe natural disaster with substantial social and economic consequences Drought becomes most obvious when large scale changes are observed however even moderate drought can have long lasting impacts on the structure and function of forests and rangelands without these obvious large scale changes Large stand level impacts of drought are already underway in the West but all U S forests are vulnerable to drought Drought associated forest disturbances are expected to increase with climatic change Management

actions can either mitigate or exacerbate the effects of drought A first principal for increasing resilience and adaptation is to avoid management actions that exacerbate the effects of current or future drought Options to mitigate drought include altering structural or functional components of vegetation minimizing drought mediated disturbance such as wildfire or insect outbreaks and managing for reliable flow of water [Selected Water Resources Abstracts](#) ,1987 *The Wildlife Techniques Manual* Nova J. Species Problems and Beyond John S. Wilkins, Frank E. Zachos, Igor Ya. Pavlinov, 2022-06-14 Species Problems and Beyond offers a collection of up to date essays discussing from an interdisciplinary perspective the many ramifications of the Species Problem. The authors represent experts in the philosophy of biology in species level evolutionary investigations and in biodiversity studies and conservation. Some of the topics addressed concern the context sensitivity of the term species, species as individuals, processes, natural kinds or as operative concepts, species delimitation in the age of Big genomic Data and taxonomic inflation and its consequences for conservation strategies. The carefully edited volume will be an invaluable resource for philosophers of biology and evolutionary biologists alike. Olivier Rieppel, Rowe Family Curator of Evolutionary Biology, Negaunee Integrative Research Center, Field Museum, USA

Species or the Species Problem is a topic in science, in the philosophy of science and in general philosophy. In fact, it encompasses many aspects of the same problem and these are dealt with in this volume. Species are often thought of as fundamental units of biological matter to be used in ecology, conservation, classification and biodiversity. The chapters in this book present opposing views on the current philosophical and conceptual issues of the Species Problem in biology. Divided into four sections: Concepts and Theories, Practice and Methods, Ranks and Trees, and Names and Metaphysics and Epistemologies, the book is authored by biologists, philosophers and historians, many leaders in their fields. Topics include ontology of species, definitions of both species category and units, species rank, speciation issues, nomenclature, ecology and species conservation. Species Problems and Beyond aims to clarify the contemporary issues of the Species Problem. It is ideal for use in upper level seminars and courses in Evolutionary Biology, Philosophy of Science, Philosophy of Biology, Systematics and Taxonomy and Phylogenetics, Cladistics and for any scholar in these fields.
