Introduction

Zea mays, commonly called corn in the United States, is one of the world's most important food crops. Because of its economic importance, the genetics of corn has been studied extensively.

In sexual reproduction, two gametes fuse, bringing together homologous chromosomes from both parents. Corn has 10 pairs of chromosomes. These chromosomes are numbered 1, 2, 3, etc. One member of the pair is inherited from the "male" parent and the other is inherited from the "female" parent. For example, on Chromosome 2, there is a gene for plant height, and there are two forms or alleles of this gene, D_2 , a dominant allele for normal height, and d_2 , a recessive allele for dwarf height. If both alleles on Chromosome pair 2 are for normal height (D_2/D_2), the phenotype (appearance or form observed) is normal height and the genotype is homozygous normal height. If the two alleles are different (D_2/d_2), the phenotype is normal height and the genotype is heterozygous normal height. If the two alleles are for dwarf height (d_2/d_2), the phenotype is dwarf height and the genotype is homozygous dwarf height or simply homozygous recessive.
