Algebraic Topology from a Homotopical Viewpoint Marcelo Aguilar, Samuel Gitler, Carlos Prieto, 2008-02-02 The authors present introductory material in algebraic topology from a novel point of view in using a homotopy theoretic approach This carefully written book can be read by any student who knows some topology providing a useful method to quickly learn this novel homotopy theoretic point of view of algebraic topology *20-Minute Learning Connection, California Middle School Edition* Douglas B. Badescu, 2013-03-14 The aim of this book is to present certain fundamental facts in the theory of algebraic surfaces defined over an algebraically closed field k of arbitrary characteristic The book is based on a series of talks given by the author in the Algebraic Geometry seminar at the Faculty of Mathematics University of Bucharest The main goal is the classification of nonsingular projective surfaces also called simply surfaces In the context of complex algebraic varieties the classification was obtained by Enriques and Castelnuovo Around 1960 Kodaira Kod1 Kod2 revived and simplified the classification of complex algebraic surfaces and extended it to the case of compact analytic surfaces The problem of classifying surfaces in arbitrary characteristic remained open The first step in this direction was the purely algebraic proof valid in arbitrary characteristic due to Zariski Zar1 Zar2 of Castelnuovo's criterion of rationality Then Mumford Mum3 Mum4 introduced several new ideas and the classification of surfaces in positive characteristic became possible Finally Bombieri and Mumford BM1 BM2 completed the classification of surfaces in arbitrary characteristic Their result was the following The same types of surfaces

that exist in the case when k is the complex field arise in the general case if one sets aside certain pathologies that arise only in characteristic 2 or 3

Basic Homological Algebra M. Scott Osborne, 2012-12-06 Five years ago I taught a one quarter course in homological algebra I discovered that there was no book which was really suitable as a text for such a short course so I decided to write one The point was to cover both Ext and Tor early and still have enough material for a larger course one semester or two quarters going off in any of several possible directions This book is also intended to be readable enough for independent study The core of the subject is covered in Chapters 1 through 3 and the first two sections of Chapter 4 At that point there are several options Chapters 4 and 5 cover the more traditional aspects of dimension and ring changes Chapters 6 and 7 cover derived functors in general Chapter 8 focuses on a special property of Tor These three groupings are independent as are various sections from Chapter 9 which is intended as a source of special topics The prerequisites for each section of Chapter 9 are stated at the beginning Some things have been included simply because they are hard to find elsewhere and they naturally fit into the discussion Lazard's theorem Section 8.4 is an example Sections 4.5 and 7 of Chapter 9 contain other examples as do the appendices at the end

ENC Focus, 2001 [Making the Connection](#) Marilyn Paula Carlson, Chris Rasmussen, 2008 The chapters in this volume convey insights from mathematics education research that have direct implications for anyone interested in improving teaching and learning in undergraduate mathematics This synthesis of research on learning and teaching mathematics provides relevant information for any math department or individual faculty member who is working to improve introductory proof courses the longitudinal coherence of precalculus through differential equations students mathematical thinking and problem solving abilities and students understanding of fundamental ideas such as variable and rate of change Other chapters include information about programs that have been successful in supporting students continued study of mathematics The authors provide many examples and ideas to help the reader infuse the knowledge from mathematics education research into mathematics teaching practice University mathematicians and community college faculty spend much of their time engaged in work to improve their teaching Frequently they are left to their own experiences and informal conversations with colleagues to develop new approaches to support student learning and their continuation in mathematics Over the past 30 years research in undergraduate mathematics education has produced knowledge about the development of mathematical understandings and models for supporting students mathematical learning Currently very little of this knowledge is affecting teaching practice We hope that this volume will open a meaningful dialogue between researchers and practitioners toward the goal of realizing improvements in undergraduate mathematics curriculum and instruction

Differential Geometry: Geometry in Mathematical Physics and Related Topics Robert Everist Greene, Shing-Tung Yau, 1993 The second of three parts comprising Volume 54 the proceedings of the Summer Research Institute on Differential Geometry held at the University of California Los Angeles July 1990 ISBN for the set is 0 8218 1493 1 Among the subjects of Part 2 are gauge theory symplectic geometry complex ge

Algebra Thomas W. Hungerford, 2012-12-06 Algebra fulfills a definite need to provide a self contained one volume graduate level algebra text that is readable by the average graduate student and flexible enough to accomodate a wide variety of instructors and course contents The guiding philosophical principle throughout the text is that the material should be presented in the maximum usable generality consistent with good pedagogy Therefore it is essentially self contained stresses clarity rather than brevity and contains an unusually large number of illustrative exercises The book covers major areas of modern algebra which is a necessity for most mathematics students in sufficient breadth and depth

Motives Uwe Jannsen, 1994 Motives were introduced in the mid 1960s by Grothendieck to explain the analogies among the various cohomology theories for algebraic varieties to play the role of the missing rational cohomology and to provide a blueprint for proving Weil's conjectures about the zeta function of a variety over a finite field Over the last ten years or so researchers in various areas Hodge theory algebraic K theory polylogarithms automorphic forms L functions ℓ -adic representations trigonometric sums and algebraic cycles have discovered that an enlarged and in part conjectural theory of mixed motives indicates and explains phenomena appearing in each area Thus the theory holds the potential of enriching and unifying these areas This is one of two volumes containing the revised texts of nearly all the lectures presented at the AMS IMS SIAM Joint Summer Research Conference on Motives held in Seattle in 1991 A number of related works are also included making for a total of forty seven papers from general introductions to specialized surveys to research papers

Resources in Education, 2001

Higher-Dimensional Algebraic Geometry Olivier Debarre, 2013-03-09 Higher Dimensional Algebraic Geometry studies the classification theory of algebraic varieties This very active area of research is still developing but an amazing quantity of knowledge has accumulated over the past twenty years The author's goal is to provide an easily accessible introduction to the subject The book covers in the beginning preparatory and standard definitions and results moves on to discuss various aspects of the geometry of smooth projective varieties with many rational curves and finishes in taking the first steps towards Mori's minimal model program of classification of algebraic varieties by proving the cone and contraction theorems The book is well organized and the author has kept the number of concepts that are used but not proved to a minimum to provide a mostly self contained introduction to graduate students and researchers
