

ALGEBRA

Equations, formulae, expressions and identities

Pupils should learn to:

Use letter symbols and distinguish their different roles in algebra

As outcomes, Year 7 pupils should, for example:

Use, read and write, spelling correctly:
algebra, unknown, symbol, variable... equals... brackets...
evaluate, simplify, substitute, solve...
term, expression, equation... squared... commutative...

Reinforce the idea of an **unknown**. Answer questions such as:

- $5 + \square = 17$
- $3 \times \square - 5 = 7$
- $\blacktriangledown + \blacklozenge = 4$. What numbers could $\blacktriangledown$ and $\blacklozenge$ be?
- The product of two numbers is 24. What could they be?

Know that letters are used to stand for numbers in algebra. Begin to distinguish between different uses of letters.

For example:

- In the equation $3n + 2 = 11$, n is a particular unknown number, but in the equation $a + b = 12$, a and b can take many different values.

Recognise algebraic conventions, such as:

- $3 \times n$ or $n \times 3$ can be thought of as '3 lots of n ,' or $n + n + n$, and can be shortened to $3n$.
- In the expression $3n$, n can take any value, but when the value of an expression is known, an equation is formed, i.e. if $3n$ is 18, the equation is written as $3n = 18$.

Understand the meaning of and begin to use simple expressions with brackets, e.g. $3(n + 2)$ meaning $3 \times (n + 2)$, where the addition operation is to be performed first and the result of this is then multiplied by 3.

Use the equals sign appropriately and correctly.

- Recognise that if $a = b$ then $b = a$, and that $a + b = c$ can also be written as $c = a + b$.
- Avoid errors arising from misuse of the sign when setting out the steps in a calculation, e.g. incorrectly writing:
 $38 + 29 = 38 + 30 = 68 - 1 = 67$

Use letter symbols to write expressions in meaningful contexts.

For example:

add 7 to a number	$n + 7$
subtract 4 from a number	$n - 4$
4 minus a number	$4 - n$
a number multiplied by 2 and then 5 added	$(n \times 2) + 5$ or $2n + 5$
a number divided by 2	$n \div 2$ or $n/2$
a number plus 7 and then multiplied by 10	$(n + 7) \times 10$ or $10(n + 7)$
a number multiplied by itself	$n \times n$ or n^2

Understand the difference between expressions such as:

$2n$ and $n + 2$	$3(c + 5)$ and $3c + 5$
n^2 and $2n$	$2n^2$ and $(2n)^2$

Awange,Erik W. Grafarend,Béla Paláncz,Piroska Zaletnyik,2010-05-27 While preparing and teaching Introduction to Geodesy I and II to undergraduate students at Stuttgart University we noticed a gap which motivated the writing of the present book Almost every topic that we taught required some skills in algebra and in particular computer algebra From positioning to transformation problems inherent in geodesy and geoinformatics knowledge of algebra and application of computer algebra software were required In preparing this book therefore we have attempted to put together basic concepts of abstract algebra which underpin the techniques for solving algebraic problems Algebraic computational algorithms useful for solving problems which require exact solutions to nonlinear systems of equations are presented and tested on various problems Though the present book focuses mainly on the two elds the concepts and techniques presented herein are nonetheless applicable to other elds where algebraic computational problems might be encountered In Engineering for example network

densification and robotics apply resection and intersection techniques which require algebraic solutions. Solution of nonlinear systems of equations is an indispensable task in almost all geosciences such as geodesy, geoinformatics, geophysics, just to mention but a few as well as robotics. These equations which require exact solutions underpin the operations of ranging, resection, intersection and other techniques that are normally used. Examples of problems that require exact solutions include three-dimensional resection problem for determining positions and orientation of sensors e.g. camera, theodolites, robots, scanners etc.
