M Mortimer, P G Taylor

Alkene Addition Kinetic Question Answer:

Alkene Polymerization Reactions with Transition Metal Catalysts Yury Kissin, 2008-03-10 During the past 30 years the field of alkene polymerization over transition metal catalysts underwent several major changes 1 The list of commercial heterogeneous Ziegler Natta catalysts for the synthesis of polyethylene and stereoregular polyolefins was completely renewed affording an unprecedented degree of control over the polymer structure 2 Research devoted to metallocene and other soluble transition metal catalysis has vastly expanded and has shifted toward complexes of transition metals with multidentate ligands 3 Recent developments in gel permeation chromatography temperature rising fractionation and crystallization fractionation provided the first reliable information about differences between various active centers in transition metal catalysts 4 A rapid development of high resolution ^{13}C NMR spectroscopy resulted in greatly expanded understanding of the chemical and steric features of polyolefins and alkene copolymers These developments require a new review of all aspects of alkene polymerization reactions with transition metal catalysts The first chapter in the book is an introductory text for researchers who are entering the field It describes the basic principles of polymerization reactions with transition metal catalysts the types of catalysts and commercially manufactured polyolefins The next chapter addresses the principal issue of alkene polymerization catalysis the existence of catalyst systems with single and multiple types of active centers The subsequent chapters are devoted to chemistry and stereochemistry of elemental reaction steps structures of catalyst precursors and reactions leading to the formation of active centers kinetics of polymerization reactions and their mechanisms The book describes the latest commercial polymerization catalysts for the synthesis of polyethylenes and polypropylene The book provides a detailed description of the multi center nature of commercial Ziegler Natta catalysts The book devotes specialized chapters to the most important aspects of transition metal polymerization catalysts the reactions leading to the formation of active centers the chemistry and stereochemistry of elemental polymerization steps reaction kinetics and the polymerization mechanism The book contains an introductory chapter for researchers who are entering the field of polymerization catalysis It describes the basic principles of polymerization reactions with transition metal catalysts and the types of commercially manufactured polyolefins and copolymers The book contains over 2000 references the most recent up to end of 2006

Investigation of Reactions Involving Pentacoordinate Intermediates Peter A Byrne,2013-02-01 In this thesis the author outlines the discovery of an effect common to representative examples of all Li salt free Wittig Reactions The implications of such a universally applicable effect are that all such Wittig reactions occur through the same mechanism Although the Wittig reaction was first discovered in 1953 its reaction mechanism has never been definitively settled with many different variants proposed and disproved The work in this thesis shows conclusively that for 2 2 cycloadditions all Wittig reactions occur by the same irreversible mechanism In addition the author also describes a new chromatography free method for the removal of phosphine oxide from the alkene crude product of the Wittig reaction The work in this thesis has led to several publications in high profile journals

Kinetics and Spectroscopy of Carbenes and Biradicals M.S. Platz, 2013-12-14 The development of mechanistic organic chemistry is filled with claims of short lived reactive intermediates connecting starting material to product In many ways this book represents a personal odyssey of the editor in this area of chemistry I well

remember my introduction to organic chemistry as an undergraduate working in the laboratories of Shelton Bank at SUNY Albany in the early 1970s and the excitement and frustration attending the piecing together of the details of a reaction mechanism by working backwards from the stable products of the reaction. In those days the reaction and the reactive intermediates flew by too rapidly to permit direct observation. Thus it came as something of a revelation to me as a graduate student at Yale that it was possible to slow down a reaction and actually see such ephemeral species as carbenes and biradicals by spectroscopic methods by generating them photochemically at cryogenic temperatures. In this monograph several chapters are devoted to low temperature studies. Dougherty has described the matrix EPR spectra of biradicals which were pure conjecture only ten years ago. Michl and Arnold have described the matrix spectroscopy of cyclobutadiene, a molecule that has fascinated organic chemists for over a hundred years. They have shown that by using a combination of matrix spectroscopic methods it is possible to learn nearly as much about the structure of cyclobutadiene, the prototypical antiaromatic biradicaloid, as about that of a common shelf stable reagent.
