the captured image frame while sun localization is performed with an edge detection algorithm to determine the solar vector coordinates. An automated positioning system helps maximize the yields of solar power plants through solar tracking control to harness the sun's energy. In such renewable energy systems, the solar panel positioning system uses sun tracking techniques and a solar angle calculator in positioning PV panels in photovoltaic systems and concentrated photovoltaic CPV systems.

Automatic on-axis solar tracking in a PV solar tracking system can be dual-axis sun tracking or single-axis sun solar tracking. It is known that a motorized positioning system in a photovoltaic panel tracker increases energy yield and ensures increased power output even in a single-axis solar tracking configuration. Other applications such as robotic solar tracker or robotic solar tracking system use robotics with artificial intelligence in the control optimization of energy yield in solar harvesting through a robotic tracking system.

Automatic positioning systems in solar tracking designs are also used in other free energy generators such as concentrated solar thermal power CSP and dish Stirling systems. The sun tracking device in a solar collector in a solar concentrator or solar collector performs on-axis solar tracking. A dual-axis solar tracker assists to harness energy from the sun through an optical solar collector which can be a parabolic mirror, parabolic reflector, Fresnel lens, or mirror array matrix. A parabolic dish or reflector is dynamically steered using a transmission system or solar tracking slew drive mechanism. In steering the dish to face the sun, the power dish actuator and actuation means in a parabolic dish system optically focusses the sun's energy on the focal point of a parabolic dish or solar concentrating means. A Stirling engine, solar heat pipe, thermosyphon, solar phase change material PCM receiver, or a fibre optic sunlight receiver means is located at the focal point of the solar concentrator. The dish Stirling engine configuration is referred to as a dish Stirling system or Stirling power generation system.

Hybrid solar power systems used in combination with biogas, biofuel, petrol, ethanol, diesel, natural gas, or PNG use a combination of power sources to harness and store solar energy in a storage medium. Any multitude of energy sources can be combined through the use of controllers and the energy stored in batteries, phase change material, thermal heat storage, and in cogeneration form converted to the required power using thermodynamic cycles: organic Rankine, Brayton cycle, micro turbine, Stirling with an inverter and charge controller.
