Geometries is a well written and comprehensive survey of college geometry that would serve a wide variety of courses for both mathematics majors and mathematics education majors Great care and attention is spent on developing visual insights and geometric intuition while stressing the logical structure historical development and deep interconnectedness of the ideas Students with less mathematical preparation than upper division mathematics majors can successfully study the topics needed for the preparation of high school teachers There is a multitude of exercises and projects in those chapters developing all aspects of geometric thinking for these students as well as for more advanced students These chapters include Euclidean Geometry Axiomatic Systems and Models Analytic Geometry Transformational Geometry and Symmetry Topics in the other chapters including Non Euclidean Geometry Projective Geometry Finite Geometry Differential Geometry and Discrete Geometry provide a broader view of geometry The different chapters are as independent as possible while the text still manages to highlight the many connections between topics The text is self contained including appendices with the material in Euclid s first book and a high school axiomatic system as well as Hilbert s axioms Appendices give brief summaries of the parts of linear algebra and multivariable calculus needed for certain chapters While some chapters use the language of groups no prior experience with abstract algebra is presumed The text will support an approach emphasizing dynamical geometry software without being tied to any particular software

Cellular Automata in Image Processing and Geometry Paul Rosin, Andrew Adamatzky, Xianfang Sun, 2014-05-29 The book presents findings views and ideas on what exact problems of image processing pattern recognition and generation can be efficiently solved by cellular automata architectures This volume provides a convenient collection in this area in which publications are otherwise widely scattered throughout the literature The topics covered include image compression and resizing skeletonization erosion and dilation convex hull computation edge detection and segmentation forgery detection and content based retrieval and pattern generation The book advances the theory of image processing pattern recognition and generation as well as the design of efficient algorithms and hardware for parallel image processing and analysis It is aimed at computer scientists software programmers electronic engineers mathematicians and physicists and at everyone who studies or develops cellular automaton algorithms and tools for image processing and analysis or develops novel architectures and implementations of massive parallel computing devices The book will provide attractive reading for a general audience because it has do it yourself appeal all the computer experiments presented within it can be implemented with minimal knowledge of programming The simplicity yet substantial functionality of the cellular automaton approach and the transparency of the algorithms proposed makes the text ideal supplementary reading for courses on image processing parallel computing automata theory and applications
