**International Conference on
Advancements of Medicine and Health Care through Technology; 23 - 26 September 2009 Cluj-Napoca, Romania**

Simona Vlad, Radu V. Ciupa, Anca I. Nicu, 2010-02-01. Projections for advances in medical and biological technology will transform medical care and treatment. This in great part is due to the result of the interaction and collaboration between medical sciences and engineering. These advances will result in substantial progress in health care and in the quality of life of the population. Frequently, however, the implications of technologies in terms of increasing recurrent costs, additional required support services, change in medical practice and training needs are underestimated. As a result, the widespread irrational use of technologies leads to a wastage of scarce resources and weakens health systems performance. To avoid such problems, a systematic and effective Health Technology System must be developed and introduced, requiring the support and commitment of decision makers of all levels of the health system. The MediTech2009 conference aims to provide a special opportunity for the Romanian professionals involved in basic research, R D industry and medical applications to exchange their know-how and build up collaboration in one of the most human fields of science and techniques. The conference is intended to be an international forum for researchers and practitioners interested in the advance in and applications of biomedical engineering to exchange the latest research results and ideas in the areas covered by the topics and not only. We believe the reader will find the proceedings an impressive document of progress to date in this rapidly changing field.

Understanding the mechanism of traumatic brain injury-induced energy metabolism Guoqiang Xing, Heng-Ye Man, Yumin Zhang, 2022-03-24. *Anatomy and Plasticity in Large-Scale Brain Models* Markus Butz, Wolfram Schenck, Arjen van Ooyen, 2017-01-05. Supercomputing facilities are becoming increasingly available for simulating activity dynamics in large scale neuronal networks. On today's most advanced supercomputers, networks with up to a billion of neurons can be readily simulated. However, building biologically realistic full scale brain models requires more than just a huge number of neurons. In addition to network size, the detailed local and global anatomy of neuronal connections is of crucial importance. Moreover, anatomical connectivity is not fixed but can rewire throughout life, structural plasticity, an aspect that is missing in most current network models in which plasticity is confined to changes in synaptic strength, synaptic plasticity. The papers in this Ebook, which may broadly be divided into three themes, aim to bring together high performance computing with recent experimental and computational research in neuroanatomy. In the first theme, fiber connectivity, new methods are described for measuring and data basing microscopic and macroscopic connectivity. In the second theme, structural plasticity, novel models are introduced that incorporate morphological plasticity and rewiring of anatomical connections. In the third theme, large scale simulations, simulations of large scale neuronal networks are presented with an emphasis on anatomical detail and plasticity mechanisms. Together, the articles in this Ebook make the reader aware of the methods and models by which large scale brain networks running on

supercomputers can be extended to include anatomical detail and plasticity **Exercises for the Anatomy & Physiology**
