

Surface Weather Map Showing Storm System in the Eastern United States

Figure 2. Simplified surface weather map showing a storm system in the eastern US.

Warm air advection occurs where the wind flows across isotherms from higher pressure (closer to lower latitude) values. Thus, warm air is being transported across a cold front by the low-level winds. Based on this fact alone, one would expect precipitation at that location to be rising. Cold air advection occurs where the wind flows across the isotherms from lower (colder) values to higher (warmer) values. Thus, cold air is being transported by the wind to a warm location, producing falling temperatures.

Based on wind directions and the isotherm pattern on the Figure 2 map, determine the type of air advection (warm or cold) that would be occurring at each station.

3. Winds at station two are occurring at Station _____.

- ☐ A
☐ B
☐ C
☐ D

4. Cold air advection was occurring at Station _____.

- ☐ B
☐ C
☐ D

5. Considering the fact that direction of wind used temperature pressure associated with weather systems, wind at Station 1 would be expected to have _____ air advection.

- ☐ warm
☐ cold

6. Meanwhile, wind at the west end (station) of Low can be expected to have _____ air advection.

- ☐ warm
☐ cold

7. Wind at the east of High can be expected to have _____ air advection.

- ☐ warm
☐ cold

8. And while you choose how that rising weather based on the model of a high, wind at the east of High should have _____ air advection.

- ☐ warm
☐ cold
