Yucesoy,Silvia Salinas Blemker,Eva Pontén,Ciaran Knut Simms,Mark Smeulders Prive,Francisco J. Valero-Cuevas,2022-01-21 Disclosure statement Topic Editor Prof Silvia Salinas Blemker is a Co founder and Vice President of Springbok Inc Charlottesville VA All other Topic Editors declare no competing interests with regards to the Research Topic subject *Virus-Based Nanomaterials and Nanostructures* Dong-Wook Han,Jin-Woo Oh,2020-06-23 A virus is considered a nanoscale organic material that can infect and replicate only inside the living cells of other organisms ranging from animals and plants to microorganisms including bacteria and archaea The structure of viruses consists of two main parts the genetic material from either DNA or RNA that carries genetic information and a protein coat called the capsid which surrounds and protects the genetic material By inserting the gene encoding functional proteins into the viral genome the functional proteins can be genetically displayed on the protein coat to form bioengineered viruses Therefore viruses can be considered biological nanoparticles with genetically tunable surface chemistry and can serve as models for developing virus like nanoparticles and even nanostructures Via this process of viral display bioengineered viruses can be mass produced with lower cost and potentially used for energy and

biomedical applications This book highlights the recent developments and future directions of virus based nanomaterials and nanostructures The virus based biomimetic materials formulated using innovative ideas were characterized for the applications of biosensors and nanocarriers The research contributions and trends on virus based materials covering energy harvesting devices to tissue regeneration in the last two decades are discussed

Physico-Chemical Control of Cell Function Cesare Gargioli, Giancarlo Forte, Alberto Rainer, 2019-10-17 Extracellular Matrix ECM has been considered for a long time merely a scaffold sustaining cell and tissue function Despite this simplistic view shared by many nowadays ECM and their mechanic physical and chemical characteristic acquired a progressive larger role actively regulating cell life survival proliferation gene expression and differentiation The interplay between cells and the ECM is continuously controlled at the cell level in a dynamic way While cells synthesize the raw components of the ECM this in turn impacts on cell function by providing chemical topographical and mechanical hints Such stimuli have been proven to control several aspects of cell function including survival proliferation differentiation and migration The molecular pathways activated by cells in response to the physical cues arising from the ECM are being disclosed and thus the possibility to control cell function through materials design is becoming more realistic Current in vitro protocols relying in 2D cell culture system entail reductionist approaches to the complexity of cell ECM interaction and result in cells rapidly losing their distinctive functions in culture Understanding and replicating the 3D microenvironmental cues affecting cell function appears as a mandatory requirement for the development of next generation biomaterials as well as for the establishment of more physiologically relevant and predictive in vitro models of diseases Such an effort will require a multidisciplinary approach at the convergence of biophysics biology nanotechnology and bioengineering

Signalling Pathways in Embryonic Development Juan J. Sanz-Ezquerro, Andrea E. Münsterberg, Sigmar Stricker, 2017-11-30 The formation of a complex multicellular organism from a single cell is one of the most amazing processes of biology Embryonic development is characterised by the careful regulation of cellular behaviours such that cells proliferate migrate differentiate and form tissues at the correct place and time These processes are genetically controlled and depend both on the history of cells their lineage and on the activities of signalling pathways which coordinate the cell interactions leading to organogenesis The aim of the Frontiers research topic Signalling pathways in embryonic development has been to provide a forum for experts in cell and developmental biology to share recent advances in the field of signalling during embryonic development Sixteen articles in a variety of formats are united in this Topic offering a valuable collection for researchers looking for an update in the knowledge of signalling pathways operating during embryogenesis The works focused mainly on vertebrates explore different aspects of this theme from cell communication to organ formation and have implications for areas as distant as

evolution or pathology Understanding developmental signalling pathways is important for several reasons It gives us information about basic mechanisms of cell function and interactions needed for morphogenesis and organogenesis It uncovers the basis of congenital malformations since errors at any step of cell signalling during development are a major cause of defects This fundamental insight gives us clues to understand the mechanisms operating in evolution that explain diversity in form and function And finally it allows the identification of possible causes of disease in the adult organism such as cancer or degenerative diseases pinpointing possible targets for therapeutic approaches

pathway UPP in the nervous system has been extensively studied both in the context of normal physiological function as well as abnormal pathological conditions Although ubiquitin was used as a marker of brain pathology the normal functions of the UPP were not studied much in the nervous system until the 1990s The early investigations focused on synaptic plasticity which was followed by studies on the roles of protein degradation in the development of the nervous system Research on the role of abnormal roles of the UPP follows a parallel trajectory Since the 2000s the field has grown to encompass many subareas of research and several model systems Despite the progress made many unanswered questions still remain For example there are many unknowns about the precise spatial and temporal control of protein degradation in the normal nervous system With respect to the roles of proteolysis in brain pathology a major challenge is to elucidate the connection between impaired protein degradation and disease progression In addition in depth studies of the roles of ubiquitin proteasome mediated proteolysis in neurodegenerative diseases are promising in identifying therapeutic targets This ebook contains original research papers and insightful reviews that cover several aspects of proteolysis by the UPP and its physiological as well as pathological functions in the nervous system
