

Analysis of a Squirrel Gene Pool

Suppose that, after a natural disaster, a small population of 2000 squirrels was left behind. Between 1970 and 1990, they existed as three isolated colonies, each with its own unique characteristics. These included the frequency of color and shape features that were inherited, isolated from movement of the other populations. In 1990, environmental conditions changed. The populations were no longer isolated. The colonies began to interbreed, creating a new gene pool. The frequency of offspring for the population changed and, over time, provided you the following data. Analyze the data and answer the questions. Write answers with complete sentences.
