Electron Crystallography of Organic Molecules J.R. Fryer, D. Dorset, 2012-12-06 Maximum Entropy ME techniques have found widespread applicability in the reconstruction of incomplete or noisy data These techniques have been applied in many areas of data analysis including imaging spectroscopy and scattering Gull and Skilling 1984 The techniques have proven particularly useful in astronomy Narayan and Nityanada 1984 In many of these applications the goal of the

reconstruction is the detection of point objects against a noisy background In this work we investigate the applicability of ME techniques to data sets which have strong components which are periodic in space or time The specific interest in our laboratory is High Resolution Electron Micrographs of beam sensitive materials However ME techniques are of general interest for all types of data These data may or may not have a spatial or temporal character Figure 1 shows an HREM image of the rigid rod polymer poly paraphenylene benzobisoxazole PBZO The 0.55 nm spacings in the image correspond to the lateral close packing between the extended polymer molecules Near the center of this crystallite there is evidence for an edge dislocation In HREM images both the frequency and position of the inflection is important for a proper interpretation Therefore it is necessary to consider how image processing affects the fidelity of this information in both real and Fourier space

Representation in the Laboratory Sciences U. Klein, 2013-04-17 constitutive of reference in laboratory sciences as cultural sign systems and their manipulation and superposition collectively shared classifications and associated conceptual frameworks and various forms of collective action and social institutions This raises the question of how much modes of representation and specific types of sign systems mobilized to construct them contribute to reference Semioticians have argued that sign systems are not merely passive media for expressing preconceived ideas but actively contribute to meaning Sign systems are culturally loaded with meaning stemming from previous practical applications and social traditions of applications In new local contexts of application they not only transfer stabilized meaning but also can be used as active resources to add new significance and modify previous meaning This view is supported by several analyses presented in this volume Sign systems can be implemented like tools that are manipulated and superposed with other types of signs to forge new representations The mode of representation made possible by applying and manipulating specific types of

representational tools such as diagrammatic rather than mathematical representations or Berzelian formulas rather than verbal language contributes to meaning and forges fine grained differentiations between scientists concepts Taken together the essays contained in this volume give us a multifaceted picture of the broad variety of modes of representation in nineteenth century and twentieth century laboratory sciences of the way scientists juxtaposed and integrated various representations and of their pragmatic use as tools in scientific and industrial practice
