

Business Math Formulas

INTRODUCTION

Business math, sometimes called **commercial math** or **consumer math**, refers to the application of arithmetic principles, computational methods, and mathematical formulas in order to solve everyday business problems and assist management in high-level decision making. Mathematical tools and models are essential for accounting, statistics, sales forecasting, inventory management, financial analysis, and marketing tasks to name a few. This Study Brief covers:

- Annuities and sinking funds
- Basic math formulas
- Finance and accounting formulas
- Human resource and project management measures
- Insurance and taxes
- Inventory management
- Manufacturing and productivity measures
- Retailing and marketing formulas
- Statistical analysis
- Stocks and bonds

ANNUITIES

Annuities: Quarter, semi-annual, and annual payments of a specific amount—even monthly—with compound interest accrued, is called an **annuity**. There are two types of annuities: **ordinary annuity** and **annuity due**.

Type	Description
Annuity Due	Payment is made at the beginning of the period. $FV = \frac{PM [(1 + r)^n - 1]}{r \times (1 + r)}$
Ordinary Annuity	Payment is made at the end of the period. $FV = \frac{PM [(1 + r)^n - 1]}{r}$

where:

FV = Future value

PM = Payment amount

r = Period interest rate

N = Number of years multiplied by the number of payments made per year

DEPRECIATION

Key Terms

- **Assets:** Items such as furniture, equipment, and/or buildings that are purchased for the operation of a business.
- **Depreciation:** A method used by a company in order to account for its assets' declining value across its useful life.

Declining Balance Method

This method operates under the assumption that depreciation occurs largely within the first year, and in decreasing amounts each year that follows. Using that assumption, the computation for depreciation is as follows:

- Divide "1" by the number of years an item is expected to last in order to find its **yearly depreciation rate**. This fraction is used as a multiplier. If used "as is," the depreciation is called a **straight-line declining balance**. If the value of N is "2," the resulting value is called a **double-declining balance**.
- After obtaining this factor, multiply the **original cost** by this factor to get the first year's depreciation.
- Multiply the **book value** (the value shown on the balance sheet for that asset) by this factor to get the depreciation for the remaining years.
- Multiplication continues for the estimated lifetime of the item or until its book value is equal to 00 its **scrap value** (when asset is no longer usable).

Note: The value of the item cannot be depreciated below its scrap value.

Straight Line Method

The assumption is that the items will depreciate by the same amount each year. It involves four factors:

- **Original Cost:** The actual price that the business paid for the item, plus any shipping costs and/or installation costs.
- **Estimated Lifetime:** This is the number of years the item is expected to be used or the number of hours of operation for which an item is used.
- **Scrap or Resale Value:** When the item is no longer useful to the company, it may be sold to another company or to a **salvage dealer**, who can dismantle the item to maximize its scrap value.
- **Book Value for a Specific year, Number of Miles, Hours of Operation, etc.:** The value of an item after depreciation is calculated.

$$\text{Annual Depreciation} = \frac{(\text{Original Cost} - \text{Salvage or Scrap Value})}{\text{Estimated Service Life}}$$

$$\text{Book Value} = \text{Original Cost} - \text{Annual Depreciation}$$

Units of Production Depreciation Method

When items are used for a specific amount of time, and then left unused for another specific period of time, the **Units of Production Depreciation** method is applied. To use this method, the depreciation per unit is first determined. To calculate, 1) divide the depreciable value by the number of units that are produced during the expected lifetime of the product. Then, 2) multiply this number by the number of units produced.

$$\text{Unit Depreciation} = \frac{\text{Depreciable Value}}{\text{Units Produced during Its Lifetime}}$$

$$\text{Depreciation} = \text{Unit Depreciation} \times \text{Number of Units Produced}$$

DISCOUNT

Discounts are offered when an item's price changes, or when the manufacturer or a wholesaler is willing to sell the items for less than their listed price.

Key Terms

List Price: The full price of an item, also known as the published or advertised price.

Net Price: The price of an item that is determined when the trade discount amount is subtracted from the list price of the item.

Trade Discount: The percent reduction in the list price of an item.

Trade Discount Series: To promote sales, the manufacturer or wholesaler may offer more than one discount on merchandise.

$$\text{Trade Discount (T)} = \text{Rate (R)} \times \text{List Price (L)}$$

$$\text{Net Price (N)} = \text{List Price (L)} - \text{Trade Discount Amount (T)}$$

Cash Discounts

In order to encourage buyers to settle their bills early, a manufacturer or wholesaler may offer discounts to buyers who pay in cash. A **cash discount** allows a buyer to deduct a certain percentage from their bill when said bill is settled in cash before the end of a given time limit.

Cash discounts are:

- Calculated only after trade discounts are deducted.
- Not applicable to merchandise that is returned.
- Not applicable to shipping charges.

Cash Discount Terms

Cash discount terms can be written as follows:

Terms	Description
$\frac{3}{5}$	2% discount can be deducted if the bill is paid within 5 days.
$\frac{2}{10}$	2% discount is taken if the bill is paid on days 6 through 10.
$\frac{2}{30}$	Full amount is paid from day 11 through 30.

After 30 days, the bill is overdue.

End-of-Month (EOM) Discount is a type of cash discount. For example, the terms might be $\frac{3}{10}$ EOM. In this case, if the bill is paid within the first 10 days of the next month, the buyer receives a 4% discount.
