Victoria Puig, Allan T. Gullledge, Evelyn K. Lambe, Guillermo Gonzalez-Burgos, 2016-01-21 High order executive tasks involve the interplay between frontal cortex and other cortical and subcortical brain regions In particular the frontal cortex striatum and thalamus interact via parallel fronto striatal loops that are crucial for the executive control of behavior In all of these brain regions neuromodulatory inputs e.g. serotonergic dopaminergic cholinergic adrenergic and peptidergic afferents regulate neuronal activity and synaptic

transmission to optimize circuit performance for specific cognitive demands Indeed dysregulation of neuromodulatory input to fronto striatal circuits is implicated in a number of neuropsychiatric disorders such as schizophrenia depression and Parkinson s disease However despite decades of intense investigation how neuromodulators influence the activity of fronto striatal circuits to generate the precise activity patterns required for sophisticated cognitive tasks remains unknown In part this reflects the complexity of the cellular microcircuits in these brain regions i e heterogeneity of neuron subtypes and connectivity cell type specific expression patterns for the numerous receptor subtypes mediating neuromodulatory signals and the potential interaction of multiple signaling cascades in individual neurons This Research Topic includes 10 original research articles and seven review articles addressing the role of neuromodulation in executive function at multiple levels of analysis ranging from the activity of single voltage dependent ion channels to computational models of network interactions in cortex striatum thalamus systems

Soekadar, 2022-02-28 **Embodiment and Co-Adaptation Through Human-Machine Interfaces: at the Border of Robotics, Neuroscience and Psychology** Philipp Beckerle, Claudio Castellini, Bigna Lenggenhager, Strahinja Dosen, 2022-04-18 **Emergent neural computation from the interaction of different forms of plasticity** Cristina Savin, Matthieu Gilson, Friedemann Zenke, 2016-03-22 From the propagation of neural activity through synapses to the integration of signals in the dendritic arbor and the processes determining action potential generation virtually all aspects of neural processing are plastic This plasticity underlies the remarkable versatility and robustness of cortical circuits it enables the brain to learn regularities in its sensory inputs to remember the past and to recover function after injury While much of the research into learning and memory has focused on forms of Hebbian plasticity at excitatory synapses LTD LTP STDP several other plasticity mechanisms have been characterized experimentally including the plasticity of inhibitory circuits Kullmann 2012 synaptic scaling Turrigiano 2011 and intrinsic plasticity Zhang

and Linden 2003 However our current understanding of the computational roles of these plasticity mechanisms remains rudimentary at best While traditionally they are assumed to serve a homeostatic purpose counterbalancing the destabilizing effects of Hebbian learning recent work suggests that they can have a profound impact on circuit function Savin 2010 Vogels 2011 Keck 2012 Hence theoretical investigation into the functional implications of these mechanisms may shed new light on the computational principles at work in neural circuits This Research Topic of Frontiers in Computational Neuroscience aims to bring together recent advances in theoretical modeling of different plasticity mechanisms and of their contributions to circuit function Topics of interest include the computational roles of plasticity of inhibitory circuitry metaplasticity synaptic scaling intrinsic plasticity plasticity within the dendritic arbor and in particular studies on the interplay between homeostatic and Hebbian plasticity and their joint contribution to network function

Integrating Computational and Neural Findings in Visual Object Perception Judith C. Peters,Hans P. Op de Beeck,Rainer Goebel,2016-06-29 The articles in this Research Topic provide a state of the art overview of the current progress in integrating computational and empirical research on visual object recognition Developments in this exciting multidisciplinary field have recently gained momentum High performance computing enabled breakthroughs in computer vision and computational neuroscience In parallel innovative machine learning applications have recently become available for datamining the large scale high resolution brain data acquired with ultra high field fMRI and dense multi unit recordings Finally new techniques to integrate such rich simulated and empirical datasets for direct model testing could aid the development of a comprehensive brain model We hope that this Research Topic contributes to these encouraging advances and inspires future research avenues in computational and empirical neuroscience
