Computational Models for Neuroscience Robert Hecht-Nielsen,Thomas McKenna,2012-12-06 Formal study of neuroscience broadly defined has been underway for millennia For example writing 2 350 years ago Aristotle asserted that association of which he defined three specific varieties lies at the center of human cognition Over the past two centuries the simultaneous rapid advancements of technology and consequently per capita economic output have fueled an exponentially increasing effort in neuroscience research Today thanks to the accumulated efforts of hundreds of thousands of scientists we possess an enormous body of knowledge about the mind and brain Unfortunately much of this knowledge is in the form of isolated factoids In terms of big picture understanding surprisingly little progress has been made since Aristotle In some arenas we have probably suffered negative progress because certain neuroscience and neurophilosophy precepts have clouded our self knowledge causing us to become largely oblivious to some of the most profound and fundamental aspects of our nature such as the highly distinctive propensity of all higher mammals to automatically segment all aspects of the world into distinct holistic objects and the massive reorganization of large portions of our brains that ensues when we encounter completely new environments and life situations At this epoch neuroscience is like a huge collection of small jagged jigsaw puzzle pieces piled in a mound in a large warehouse with neuroscientists going in and tossing more pieces onto the mound every month
