computational technical or theoretical studies with relevance for understanding biological information processing and artificial implementation of biological information processing and self organising principles *What can simple brains teach us about how vision works* Davide Zoccolan, David D. Cox, Andrea Benucci, R. Clay Reid, 2015-11-18 Vision is the process of extracting behaviorally relevant information from patterns of light that fall on retina as the eyes sample the outside world Traditionally nonhuman primates macaque monkeys in particular have been viewed by many as the animal model of choice for investigating the neuronal substrates of visual processing not only because their visual systems closely mirror our own but also because it is often assumed that simpler brains lack advanced visual processing machinery However this narrow view of visual neuroscience ignores the fact that vision is widely distributed throughout the animal kingdom enabling a wide repertoire of complex behaviors in species from insects to birds fish and mammals Recent years have seen a resurgence of interest in alternative animal models for vision research especially rodents This resurgence is partly due to the availability of increasingly powerful experimental approaches e g optogenetics and two photon imaging that are challenging to apply to their full potential in primates Meanwhile even more phylogenetically distant species such as birds fish and insects have long been workhorse animal models for gaining insight into the core computations underlying visual processing In many cases these animal models are valuable precisely because their visual systems are simpler than the primate visual system Simpler systems are often easier to understand and studying a diversity of neuronal systems that achieve similar functions can focus attention on those computational principles that are universal and essential This Research Topic provides a survey of the state of the art in the use of animal models of visual functions that are alternative to macaques It includes original research methods articles reviews and opinions that exploit a variety of animal models including rodents birds fishes and insects as well as small New World monkey the marmoset to investigate visual function The experimental approaches covered by these studies range from psychophysics and electrophysiology to histology and genetics testifying to the richness and depth of visual neuroscience in non macaque species Transforming Communication in Leadership and Teamwork Renate Motschnig, David Ryback, 2016-11-07 This accessible highly interactive book presents a transformative approach to communication in leadership to meet workplace challenges at both local and global levels Informed by neuroscience psychology as well as leadership science it explains how integrating and properly balancing two key focal points of management the tasks at hand and the concerns of others and self can facilitate decision making partnering with diverse colleagues and handling of crises and conflicts Case examples a self test friendly calls for reflection and practical exercises provide readers with varied opportunities to assess support and evoke their readiness to apply these real world concepts to their own style and preferences Together these chapters demonstrate the best outcomes of collaborative communication greater effectiveness deeper empathy with improved emotional fulfillment and lasting positive change Included in the coverage As a manager can I be human Using the two agenda approach for more effective and humane management Being

and becoming a person centered leader and manager in a crisis environment Methods for transforming communication dialogue Open Case A new setting for problem solving in teams Integrating the two agendas in agile management Tasks and people what neuroscience reveals about managing both more effectively Transforming communication in multicultural contexts for better understanding across cultures As a skill building resource Transforming Communication in Leadership and Teamwork offers particular value to diverse business professionals including managers leaders and team members seeking to become more effective business consultants and coaches working with people in executive positions and or teams leaders and members of multi national teams executives decision makers and organizational developers instructors and students of courses on effective communication social and professional skills human resources communication and digital media leadership teamwork and related subjects
