Algebraic Operads Jean-Louis Loday, Bruno Vallette, 2012-08-08 In many areas of mathematics some higher operations are arising These have become so important that several research projects refer to such expressions Higher operations form new types of algebras The key to understanding and comparing them to creating invariants of their action is operad theory This is a point of view that is 40 years old in

algebraic topology but the new trend is its appearance in several other areas such as algebraic geometry mathematical physics differential geometry and combinatorics The present volume is the first comprehensive and systematic approach to algebraic operads An operad is an algebraic device that serves to study all kinds of algebras associative commutative Lie Poisson A infinity etc from a conceptual point of view The book presents this topic with an emphasis on Koszul duality theory After a modern treatment of Koszul duality for associative algebras the theory is extended to operads Applications to homotopy algebra are given for instance the Homotopy Transfer Theorem Although the necessary notions of algebra are recalled readers are expected to be familiar with elementary homological algebra Each chapter ends with a helpful summary and exercises A full chapter is devoted to examples and numerous figures are included After a low level chapter on Algebra accessible to advanced undergraduate students the level increases gradually through the book However the authors have done their best to make it suitable for graduate students three appendices review the basic results needed in order to understand the various chapters Since higher algebra is becoming essential in several research areas like deformation theory algebraic geometry representation theory differential geometry algebraic combinatorics and mathematical physics the book can also be used as a reference work by researchers

Linear Algebra and Optimization for Machine Learning Charu C. Aggarwal, 2020-05-13 This textbook introduces linear algebra and optimization in the context of machine learning Examples and exercises are provided throughout the book A solution manual for the exercises at the end of each chapter is available to teaching instructors This textbook targets graduate level students and professors in computer science mathematics and data science Advanced undergraduate students can also use this textbook The chapters for this textbook are organized as follows 1 Linear algebra and its applications The chapters focus on the basics of linear algebra together with their common applications to singular value decomposition matrix factorization similarity matrices kernel methods and graph analysis Numerous machine learning applications have been used as examples such as spectral clustering kernel based classification and outlier detection The tight integration of linear algebra methods with examples from machine learning differentiates this book from generic volumes on linear algebra The focus is clearly on the most relevant aspects of linear algebra for machine learning and to teach readers how to apply these concepts 2 Optimization and its applications Much of machine learning is posed as an optimization problem in which we try to maximize the accuracy of regression and classification models The parent problem of optimization centric machine learning is least squares regression Interestingly this problem arises in both linear algebra and optimization and is one of the key connecting problems of the two fields Least squares regression is also the starting point for support vector machines logistic regression and recommender systems Furthermore the methods for dimensionality reduction and matrix factorization also require the development of optimization methods A general view of optimization in computational graphs is discussed together with its applications to back propagation in neural networks A frequent challenge faced by beginners in machine learning is the extensive background

required in linear algebra and optimization One problem is that the existing linear algebra and optimization courses are not specific to machine learning therefore one would typically have to complete more course material than is necessary to pick up machine learning Furthermore certain types of ideas and tricks from optimization and linear algebra recur more frequently in machine learning than other application centric settings Therefore there is significant value in developing a view of linear algebra and optimization that is better suited to the specific perspective of machine learning

Cardinal Invariants on Boolean Algebras J. Donald Monk, 2010-03-25 This text covers cardinal number valued functions defined for any Boolean algebra such as cellularity It explores the behavior of these functions under algebraic operations such as products free products ultraproducts and their relationships to each other

Generative Complexity in Algebra Joel Berman, 2005 Considers the behavior of $G_{\mathcal{C},k}$ when $\mathcal{C}$ is a locally finite equational class variety of algebras and k is finite This title looks at ways that algebraic properties of $\mathcal{C}$ lead to upper or lower bounds on generative complexity

Graduate Algebra: Commutative View Louis Halle Rowen, 2006 This book is an expanded text for a graduate course in commutative algebra focusing on the algebraic underpinnings of algebraic geometry and of number theory Accordingly the theory of affine algebras is featured treated both

directly and via the theory of Noetherian and Artinian modules and the theory of graded algebras is included to provide the foundation for projective varieties Major topics include the theory of modules over a principal ideal domain and its applications to matrix theory including the Jordan decomposition the Galois theory of field extensions transcendence degree the prime spectrum of an algebra localization and the classical theory of Noetherian and Artinian rings Later chapters include some algebraic theory of elliptic curves featuring the Mordell Weil theorem and valuation theory including local fields One feature of the book is an extension of the text through a series of appendices This permits the inclusion of more advanced material such as transcendental field extensions the discriminant and resultant the theory of Dedekind domains and basic theorems of rings of algebraic integers An extended appendix on derivations includes the Jacobian conjecture and Makar Limanov's theory of locally nilpotent derivations Grobner bases can be found in another appendix Exercises provide a further extension of the text The book can be used both as a textbook and as a reference source
