Statistical Benchmarks for Quantum Transport in Complex Systems Mattia Walschaers, 2018-07-31 This book introduces a variety of statistical tools for characterising and designing the dynamical features of complex quantum systems These tools are applied in the contexts of energy transfer in photosynthesis and boson sampling In dynamical quantum systems complexity typically manifests itself via the interference of a rapidly growing number of paths that connect the initial and final states The book presents the language of graphs and networks providing a useful framework to discuss such scenarios and explore the rich phenomenology of transport phenomena As the complexity increases deterministic approaches rapidly become intractable which leaves statistics as a viable alternative

Computational Models of Argument P. Baroni, T.F. Gordon, T. Scheffler, 2016-09-02 Research into computational models of argument is a rich interdisciplinary field involving the study of natural artificial and theoretical argumentation and requiring openness to interactions with a variety of disciplines ranging from philosophy and cognitive science to formal logic and graph theory The ultimate aim is to support the development of computer based systems able to engage in argumentation related activities either with human users or among themselves This book presents the proceedings of the sixth biennial International Conference on Computational Models of Argument COMMA 2016 held in Potsdam Germany on 12-16 September The aim of the COMMA conferences is to bring together researchers interested in computational models of argument and the representation of argumentation structures in natural language texts with special attention to contributions concerning emerging trends and the development of new connections with other areas The book contains the 25 full papers 17 short papers and 10 demonstration abstracts presented at the conference together with 3 invited talks Subjects covered include abstract bipolar and structured argumentation quantitative approaches and their connections with formalisms like Bayesian networks and fuzzy logic multi agent scenarios algorithms and solvers and mining arguments in text dialogue and social media The book provides an overview of current research and developments in the field of computational models of argument and will be essential reading for all those with an interest in the field

Energy Transfers in Atmosphere and Ocean Carsten Eden, Armin Iske, 2019-01-23 This book describes a recent effort combining interdisciplinary expertise within the Collaborative Research Centre Energy transfers in atmosphere and ocean TRR 181 which was funded by the German Research Foundation DFG Energy transfers between the three dynamical regimes small scale turbulence internal gravity waves and geostrophically balanced motion are fundamental to the energy cycle of both the atmosphere and the ocean Nonetheless they remain poorly understood and quantified and have yet to be adequately represented in today s climate models Since interactions between the dynamical regimes ultimately link the smallest scales to the largest ones through a range of complex processes understanding these interactions is essential to constructing atmosphere and ocean models and to predicting the future climate To this end TRR 181 combines expertise in applied mathematics meteorology and physical oceanography This book provides an overview of

representative specific topics addressed by TRR 181 ranging from a review of a coherent hierarchy of models using consistent scaling and approximations and revealing the underlying Hamiltonian structure a systematic derivation and implementation of stochastic and backscatter parameterisations an exploration of the dissipation of large scale mean or eddying balanced flow and ocean eddy parameterisations and a study on gravity wave breaking and mixing the interaction of waves with the mean flow and stratification wave wave interactions and gravity wave parameterisations to topics of a more numerical nature such as the spurious mixing and dissipation of advection schemes and direct numerical simulations of surface waves at the air sea interface In TRR 181 the process oriented topics presented here are complemented by an operationally oriented synthesis focusing on two climate models currently being developed in Germany In this way the goal of TRR 181 is to help reduce the biases in and increase the accuracy of atmosphere and ocean models and ultimately to improve climate models and climate predictions

Computer Algebra and Polynomials Jaime Gutierrez,Josef Schicho,Martin Weimann,2015-01-20 Algebra and number theory have always been counted among the most beautiful mathematical areas with deep proofs and elegant results However for a long time they were not considered that important in view of the lack of real life applications This has dramatically changed nowadays we find applications of algebra and number theory frequently in our daily life This book focuses on the theory and algorithms for polynomials over various coefficient domains such as a finite field or ring The operations on polynomials in the focus are factorization composition and decomposition basis computation for modules etc Algorithms for such operations on polynomials have always been a central interest in computer algebra as it combines formal the variables and algebraic or numeric the coefficients aspects The papers presented were selected from the Workshop on Computer Algebra and Polynomials which was held in Linz at the Johann Radon Institute for Computational and Applied Mathematics RICAM during November 25 29 2013 at the occasion of the Special Semester on Applications of Algebra and Number Theory
