Environmental Change Richard J. Huggett, 1997 *Environmental Change* presents an introductory exploration of past present and future change in the environment Combining the ecological and evolutionary approaches brought forth in his related title *Geocology* Huggett introduces the interconnected aspects of the natural environment ecological geological and cosmic and the dynamic nature of the environmental system The book examines human environment interaction and biological and physical evidence and causes of environmental change over a range of timescales Exploring rates and directions of change Huggett postulates an unending adaption of the ecosphere and its parts to ever changing circumstances including those triggered by human actions and looks towards likely environmental changes in the future [Responses to Climate Change in the Cold Biomes](#) Hans J. De Boeck, Erika Hiltbrunner, Anke Jentsch, Vigdis Vandvik, 2019-06-05 Climate change is thought to be especially relevant to ecosystems in the cold biomes Observed warming has been higher in cold climates through various positive feedbacks especially declining snow and ice cover and climate projections indicate further rapid warming in the decades to come Temperature change can have profound impacts in cold biome ecosystems either directly in terms of impacts on physiology or growing season length or indirectly via changes in nutrient cycling The regions focused on here are the sub arctic and the sub alpine areas both characterized by short growing seasons and low annual temperatures but with different radiation environments depending on latitude Climate change can have impacts in all seasons Increased spring temperatures can accelerate snowmelt leading to an earlier onset of the growing season while warmer summers may stimulate primary productivity through temperatures closer to metabolic optima and or increased mineralization rates Winter warming can lead to the vegetation being damaged because of exposure to harsh frost without insulating snow cover In all of this concurrent changes in precipitation also play an important role increased snowfall can buffer warming induced advances in snowmelt a higher ratio of rain to snow can greatly accelerate snowmelt in winter and spring and summer drought may reverse growth stimulation by warming directly drought stress or indirectly e g impaired nutrient uptake Micro climate is crucial in these systems and requires particular attention as it can vary widely across the landscape creating different growing environments in the space of a few meters or even less Interest in cold region responses to climate change does not only arise from the fact that they harbor unique ecosystems that may be endangered but also because they store large amounts of carbon that may be released under climate change However research is challenging because of the remoteness of many of these areas and the harsh conditions during much of the year In spite of this some studies have been carried out over an extensive period spanning decades and yielding information on for example

plant community reorganization including invasions and changes in phenology above and or belowground Other studies focus on shorter term effects such as impacts of heat waves late frosts or other anomalous weather including longer term after effects that may differ drastically from other regions because of the short growing season in cold climates Ultimately models are used to predict future changes in vegetation along latitudinal or elevational gradients although phenology and microclimatic variation may pose particular challenges Contributions to this Research Topic focus on climate change encompassing both changes in the mean gradual warming and variability heat waves altered precipitation distribution in cold biomes The Topic contains reports on observed changes or events but also research making use of experimentally imposed environmental changes The focus is varied including phenology physiology soil and vegetation science and biogeochemistry with the aim of providing a comprehensive overview of observed and expected responses to climate change in cold biome ecosystems
