Advanced Environmental Chemistry V K Ahluwalia, 2017-05-09 Environmental chemistry is becoming increasingly crucial in understanding important issues that range from climate change to local pollution problems. It is the study of the chemical and biochemical phenomena that occur in the environment. It also studies the effects of these chemicals on ecosystems, animals, and human health. Advanced Environmental Chemistry discusses the environment and its biological cycles. The book provides students and professionals with a clear understanding of the science and its applications. It provides an in-depth introduction to the chemical composition of the atmosphere and water. The author also thoroughly explores important concepts such as soil pollution, radioactive pollution, and environmental toxicology. All the chapters are followed by multiple choice and short answer questions.

Handbook of Chemical Mass Transport in the Environment Louis J. Thibodeaux, Donald Mackay, 2010-10-21 A comprehensive account of the state of the science of environmental mass transport. Edited by Louis J. Thibodeaux and Donald Mackay, renowned experts in this field, the Handbook of Chemical Mass Transport in the Environment covers those processes which are critically important for assessing chemical fate, exposure, and risk. In a comprehensive and authoritative format, this unique handbook provides environmental chemists, geoscientists, engineers, and modelers with the essential capabilities to understand and quantify transport. In addition, it offers a one-stop resource on environmental mass transfer and mass transport coefficient estimation methods for all genres. The book begins by discussing mass transport fundamentals from an environmental perspective. It introduces the concept of mobility, key to environmental fate, since transport must occur prior to any reaction or partitioning within the natural multimedia compartments. The fugacity approach to environmental mass transfer and the conventional approach are examined. This is followed by a description of the individual mass transport processes and the appropriate flux equations required for a quantitative expression. The editors have identified 41 individual processes believed to be the most environmentally significant, which form the basis for the remainder of the book. Using a consistent format for easy reference, each chapter introduces the specific processes, provides a detailed qualitative description, presents key theoretical/mathematical formulations, describes field or laboratory measurements of transport parameters, gives data tables and algorithms for numerical estimates, offers a guide for users familiar with the process who are seeking a direct pathway to obtain the numerical coefficients, presents computed example problems, case studies, and/or exercises with worked-through solutions and answers. The final chapter presents the editors' insight into future needs and emerging priorities. Accessible and relevant to a broad range of science and engineering users, this volume captures the state of the transport science and practice in this critical area.
