Alice Programming Manual:

Handbook of Constraint Programming Francesca Rossi, Peter van Beek, Toby Walsh, 2006-08-18 Constraint programming is a powerful paradigm for solving combinatorial search problems that draws on a wide range of techniques from artificial intelligence computer science databases programming languages and operations research Constraint programming is currently applied with success to many domains such as scheduling planning vehicle routing configuration networks and bioinformatics The aim of this handbook is to capture the full breadth and depth of the constraint programming field and to be encyclopedic in its scope and coverage While there are several excellent books on constraint programming such books necessarily focus on the main notions and techniques and cannot cover also extensions applications and languages The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential Of course each line of work is dealt with in a survey like style where some details may be neglected in favor of coverage However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details Each chapter of the handbook is intended to be a self contained survey of a topic and is written by one or more authors who are leading researchers in the area The intended audience of the handbook is researchers graduate students higher year undergraduates and practitioners who wish to learn about the state of the art in constraint programming No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge Researchers from other fields should find in this handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications

Industrial Parsing of Software Manuals Richard F.E. Sutcliffe, 2023-11-27 The task of language engineering is to develop the technology for

building computer systems which can perform useful linguistic tasks such as machine assisted translation text retrieval message classification and document summarisation Such systems often require the use of a parser which can extract specific types of grammatical data from pre defined classes of input text There are many parsers already available for use in language engineering systems However many different linguistic formalisms and parsing algorithms are employed Grammatical coverage varies as does the nature of the syntactic information extracted Direct comparison between systems is difficult because each is likely to have been evaluated using different test criteria In this volume eight different parsers are applied to the same task that of analysing a set of sentences derived from software instruction manuals Each parser is presented in a separate chapter Evaluation of performance is carried out using a standard set of criteria with the results being presented in a set of tables which have the same format for each system Three additional chapters provide further analysis of the results as well as discussing possible approaches to the standardisation of parse tree data Five parse trees are provided for each system in an appendix allowing further direct comparison between systems by the reader The book will be of interest to students researchers and practitioners in the areas of computational linguistics computer science information retrieval language engineering linguistics and machine assisted translation
