

A4 Coolant Fan testing, MANUAL Air Conditioning

REV 7 6/18/2009

Fan response to Air Conditioner.

Remember both fans should come on in slow speed any time the key is on and the AC is on – if the temperature is above about 32 F (0 C). If one fan runs, so should the other – they do not sequence on, or anything fancy. If both fans run for this test, and you have no evidence of other problems, there is little reason to test further.

Low refrigerant pressure will lock out both fans and the AC clutch.

High refrigerant pressure will put both fans in Fast speed.

S180 (fuse 8, 30 amps, green plastic, above battery) must be good for slow speed operation.

A common problem is that this fuse will not blow, but the terminals it mounts to will be damaged by excess heat.

Pull this fuse and examine the area underneath it. You should see shiny copper or brass where the fuse makes contact, if it is dark and discolored, or there is evidence of excess heat such as melted plastic, then you need to repair or replace this fuse holder. Try unbolting the terminal leads and prying the mounting box open, then cleaning the required areas with an Emory board, and bending them back into shape.

This fuse provides power to both the radiator thermostatswitch and to the Fan Control Module (FCM). If the FCM does not see power from this fuse it will not power the A/C compressor clutch.

S164 (fuse 3, 40 amps, metal strip, above battery) must be good for fast speed operation.

To ensure the AC circuits and the Fan Control Module has power check:

Fuse 5 on the cabin fuse panel.

Fuse 16 on the cabin fuse panel. **When this fuse is blown the radiator fans will often run unexpectedly.**

Fuse 25 on the cabin fuse panel.
