Braha,O. Maimon,2013-04-17 Formal Design Theory PDT is a mathematical theory of design The main goal of PDT is to develop a domain independent core model of the design process The book focuses the reader s attention on the process by which ideas originate and are developed into workable products In developing PDT we have been striving toward what has been expressed by the distinguished scholar Simon 1969 that the science of design is possible and some day we will be able to talk in terms of well established theories and practices The book is divided into five

interrelated parts The conceptual approach is presented first Part I followed by the theoretical foundations of PDT Part II and from which the algorithmic and pragmatic implications are deduced Part III Finally detailed case studies illustrate the theory and the methods of the design process Part IV and additional practical considerations are evaluated Part V The generic nature of the concepts theory and methods are validated by examples from a variety of disciplines FDT explores issues such as algebraic representation of design artifacts idealized design process cycle and computational analysis and measurement of design process complexity and quality FDT's axioms convey the assumptions of the theory about the nature of artifacts and potential modifications of the artifacts in achieving desired goals or functionality By being able to state these axioms explicitly it is possible to derive theorems and corollaries as well as to develop specific analytical and constructive methodologies

Process Planning Optimization in Reconfigurable Manufacturing Systems Farayi Musharavati, 2010-09 Trends and perspectives in dynamic environments point towards a need for optimal operating levels in reconfigurable manufacturing activities Central to the goal of meeting this need is the issue of appropriate techniques for manufacturing process planning optimization in reconfigurable manufacturing i e i what decision making models and ii what computational techniques provide an optimal manufacturing process planning solution in a multidimensional decision variables space Conventional optimization techniques are not robust hence they are not suitable for handling multidimensional search spaces On the other hand process planning optimization for reconfigurable manufacturing is not amenable to classical modeling approaches due to the presence of complex system dynamics Therefore this study explores how to model reconfigurable manufacturing activities in an optimization perspective and how to develop and select appropriate non conventional optimization techniques for reconfigurable process planning In this study a new approach to modeling Manufacturing Process Planning Optimization MPPO was developed by extending the concept of manufacturing optimization through a decoupled optimization method The uniqueness of this approach lies in embedding an integrated scheduling function into a partially integrated process planning function in order to exploit the strategic potentials of flexibility and reconfigurability in manufacturing systems Alternative MPPO models were constructed and variances associated with their utilization analyzed Five 5 Alternative Algorithm Design Techniques AADTs were developed and investigated for suitability in providing process planning solutions suitable for

reconfigurable manufacturing The five 5 AADTs include a variant of the simulated annealing algorithm that implements heuristic knowledge at critical decision points two 2 cooperative search schemes based on a loose hybridization of the Boltzmann Machine algo *Applications of Multi-objective Evolutionary Algorithms* Carlos A.
