

The Digestive System

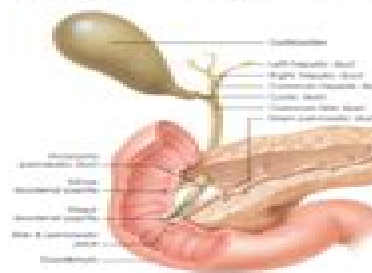

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food enters through the mouth, is broken down in the stomach, and then moves through the small intestine, where nutrients are absorbed. The digestive system also includes accessory organs that help in the process, such as the liver, pancreas, and gallbladder.

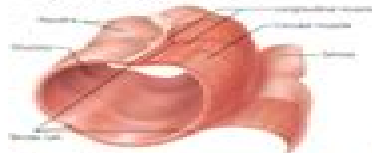

Liver, pancreas & gallbladder

After leaving the stomach, digested material enters the duodenum, the first part of the small intestine, where it is mixed with bile secreted by the **liver**. The liver is a large organ on the right side of the abdomen. It produces bile, which is stored in the **gallbladder**. The pancreas, located behind the stomach, produces pancreatic juice, which is also secreted into the duodenum.

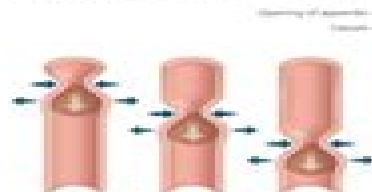

Layers of large intestine

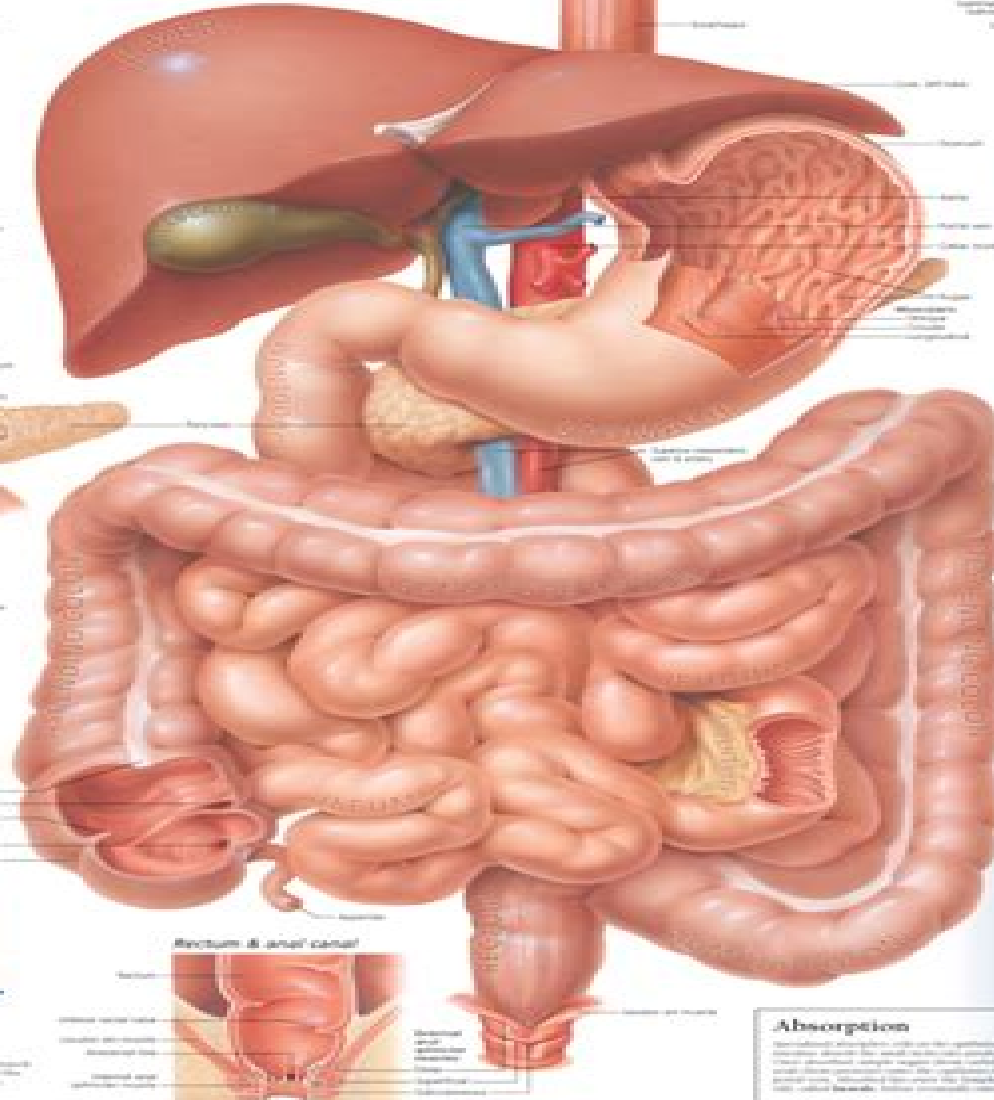

Large intestine

The large intestine consists of the cecum, the appendix, the ascending colon, the transverse colon, the descending colon, and the sigmoid colon. It is responsible for absorbing water and electrolytes from the remaining indigestible food matter.

Peristaltic action

Food material is pushed through the digestive system by a series of powerful muscular contractions called peristalsis. These contractions move the material forward and the wave which, when it moves, the material is pushed forward.

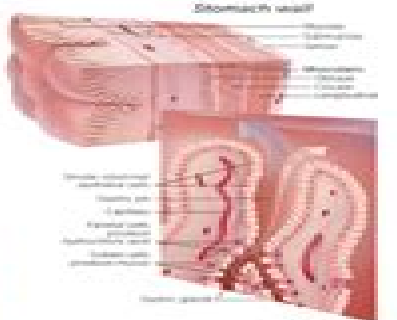

The mouth & salivary glands

Chewing, the mechanical action of the food, begins in the mouth. The tongue mixes the food with the secretions of the salivary glands, which moisten the food and help in swallowing. The salivary glands are located in the mouth and produce saliva, which contains the enzyme amylase that begins the digestion of starch.

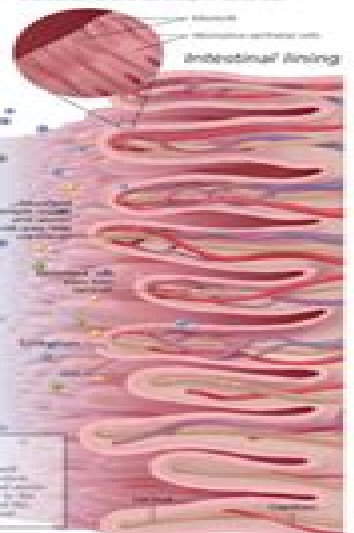

The stomach

The stomach is a large, muscular organ that is responsible for the mechanical and chemical digestion of food. It is located in the upper left part of the abdomen. The stomach wall is composed of several layers, including the mucosa, which contains the gastric glands that secrete gastric juice.

Small intestine

The small intestine consists of three parts: the duodenum, the jejunum, and the ileum. It is responsible for the chemical digestion of food and the absorption of nutrients. The small intestine is highly coiled and has a large surface area for absorption.

Absorption

The process of absorption occurs in the small intestine. The nutrients from the digested food are absorbed into the blood and lymphatic system. The remaining material moves on to the large intestine.
