contributions in this volume aim to deepen understanding of some of the current research problems and theories in modern topics such as calculus of variations optimization theory complex analysis real analysis differential equations and geometry Applications to these areas of mathematics are presented within the broad spectrum of research in Engineering Science with particular emphasis on equilibrium problems complexity in numerical optimization dynamical systems non smooth optimization complex network analysis statistical models and data mining and energy systems Additional emphasis is given to interdisciplinary research although subjects are treated in a unified and self contained manner The presentation of methods theory and applications makes this tribute an invaluable reference for teachers researchers and other professionals interested in pure and applied research philosophy of mathematics and mathematics education Some review papers published in this volume will be particularly useful for a broader audience of readers as well as for graduate students who search for the latest information Constantin Carathéodory's wide ranging influence in the international mathematical community was seen during the first Fields Medals awards at the International Congress of Mathematicians Oslo 1936 Two medals were awarded one to Lars V Ahlfors and one to Jesse Douglass It was Carathéodory who presented both their works during the opening of the International Congress This volume contains significant papers in Science and Engineering dedicated to the memory of Constantin Carathéodory and the spirit of his mathematical influence

Locally Convex Spaces M. Scott Osborne, 2013-11-08 For most practicing analysts who use functional analysis the restriction to Banach spaces seen in most real analysis graduate texts is not enough for their research This graduate text while focusing on locally convex topological vector spaces is intended to cover most of the general theory needed for application to other areas of analysis Normed vector spaces Banach spaces and Hilbert spaces are all examples of classes of locally convex spaces which is why this is an important topic in functional analysis While this graduate text focuses on what is needed for applications it also shows the beauty of the subject and motivates the reader with exercises of varying difficulty Key topics covered include point set topology topological vector spaces the Hahn Banach theorem seminorms and Fréchet spaces uniform boundedness and dual spaces The prerequisite for this text is the Banach space theory typically taught in a beginning graduate real analysis course

Spectral Analysis of Growing Graphs Nobuaki Obata, 2017-02-17 This book is designed as a concise introduction to the recent achievements on spectral analysis of graphs or networks from the point of view of quantum or non commutative probability theory The main topics are spectral distributions of the adjacency matrices of finite or infinite graphs and their limit distributions for growing graphs The main vehicle is quantum probability an algebraic extension of the traditional probability theory which provides a new framework for the analysis of adjacency matrices revealing their non commutative nature For example the method of quantum decomposition makes it possible to study spectral distributions by means of interacting Fock spaces or equivalently by orthogonal polynomials Various concepts of independence in quantum probability and corresponding central limit theorems are used for the asymptotic study of spectral distributions for product

graphs This book is written for researchers teachers and students interested in graph spectra their asymptotic spectral distributions and various ideas and methods on the basis of quantum probability It is also useful for a quick introduction to quantum probability and for an analytic basis of orthogonal polynomials
