

MENSTRUAL CYCLE LAB

Background Information

Puberty and the Menstrual Cycle

When a human female is born, her ovaries already contain all the immature eggs that will later mature and produce functional eggs during her lifetime. Eggs usually begin to mature between the ages of 12 and 14, when a release of hormones triggers **puberty**, and a young woman reaches sexual maturity. Most commonly, eggs mature every 28 days or so. They usually mature **ONE** at a time, in alternating ovaries. This rhythmic maturation of eggs and of chemical and physical events are called the **menstrual cycle**.

Endocrine Gland	Hormone	Function
 Anterior Pituitary	FSH	• Stimulates follicular growth in ovaries • Stimulates estrogen secretion (from developing follicles)
	LH	• Surge causes ovulation • Results in the formation of a corpus luteum
 Ovaries	Estrogen	• Thickens uterine lining (endometrium) • Inhibits FSH and LH for most of cycle • Stimulates FSH and LH release pre-ovulation
	Progesterone	• Thickens uterine lining (endometrium) • Inhibits FSH and LH

The Pituitary Gland

The pituitary gland is located at the base of the brain and secretes the hormones **FSH** and **LH**. Increasing levels of a hormone, **FSH (follicle stimulating hormone)**, eggs start to mature in a woman's ovary. Each egg matures inside an egg sac, or follicle. When the egg is fully mature, another hormone, **LH (luteinizing hormone)** reaches peak level, causing the follicle to burst and the release of the egg. The process is called ovulation. Tiny microscopic hairs called cilia at the opening to the Fallopian tube will sweep the egg into the tube which leads to the uterus.

- **FSH** stimulates the egg to mature
- **LH** causes the egg to rupture from the ovary in a process called **ovulation**!

The Ovary

The ovary produces the hormones **estrogen** and **progesterone**. As a result of the increasing levels of the hormone **estrogen**, the lining of the uterus has been prepared to receive a fertilized egg by building up its lining with nurturing tissues and blood vessels. After ovulation, the ovary releases the hormone **progesterone**. High levels of **progesterone** to help maintain the uterine lining.

- **Estrogen** builds up the uterine lining
- **Progesterone** maintains the uterine lining

Answers To The Human Menstrual Cycle Lab

Arthur T. Winfree

Answers To The Human Menstrual Cycle Lab:

The Geometry of Biological Time Arthur T. Winfree, 2013-06-29 As I review these pages the last of them written in Summer 1978 some retrospective thoughts come to mind which put the whole business into better perspective for me and might aid the prospective reader in choosing how to approach this volume The most conspicuous thought in my mind at present is the diversity of wholly independent explorations that came upon phase singularities in one guise or another during the past decade My efforts to gather the published literature during the last phases of actually writing a whole book about them were almost equally divided between libraries of Biology Chemistry Engineering Mathematics Medicine and Physics A lot of what I call gathering was done somewhat in anticipation in the form of conjecture query and prediction based on analogy between developments in different fields The consequence throughout 1979 was that our long suffering publisher repeatedly had to replace such material by citation of unexpected flurries of papers giving substantive demonstration I trust that the authors of these many excellent reports and especially of those I only found too late will forgive the brevity of allusion I felt compelled to observe in these substitutions A residue of loose ends is largely collected in the index under QUERIES It is clear to me already that the materials I began to gather several years ago represented only the first flickering of what turns out to be a substantial conflagration

The Menstrual Cycle Anne Walker, 2008-03-07 Anne Walker shows that women are neither the victims of raging hormonal fluctuations nor entirely unaffected by them Unlike most previous publications that focus on menstruation a part of the cycle The Menstrual Cycle presents a well researched study of the entire menstrual cycle and its relationship to women's lives Women's own experiences in different cultures are contrasted with medical textbook descriptions and the normal is found to be rather elusive This book will be read by discourse analysts doctors nurses and any woman who has felt curious about her menstrual cycle and its possible effects
