Designing Engineering Structures using Stochastic Optimization Methods Levent Aydin,H. Seçil Artem,Selda Oterkus,2020-04-27 Among all aspects of engineering design is the most important step in developing a new product A systematic approach to managing design issues can only be accomplished by applying mathematical optimization methods Furthermore due to the practical issues in engineering problems there are limitations in using traditional methods As such stochastic optimization methods such as differential evolution simulated annealing and genetic algorithms are preferable in finding solutions in design optimization problems This book reviews mechanical engineering design optimization using stochastic methods It introduces students and design engineers to practical aspects of complicated mathematical optimization procedures and outlines steps for wide range of selected engineering design problems It shows how engineering structures are systematically designed Many new engineering design applications based on stochastic optimization techniques in automotive energy military naval manufacturing process and fluids heat transfer are described in the book For each design optimization problem described background is provided for understanding the solutions There are very few books on optimization that include engineering applications They cover limited applications and that too of well known design problems of advanced and niche nature Common problems are hardly addressed Thus the subject has remained fairly theoretical To overcome this each chapter in this book is contributed by at least one academic and one industrial expert researcher

Heat Transfer in Energy Conversion Systems Alessandro Mauro,Nicola Massarotti,Laura Vanoli,2021-07-27 In recent years the scientific community's interest towards efficient energy conversion systems has significantly increased One of the reasons is certainly related to the change in the temperature of the planet which appears to have increased by 0.76 C with respect to pre industrial levels according to the Intergovernmental Panel on Climate Change IPCC and this trend has not yet been stopped The European Union considers it vital to prevent global warming from exceeding 2 C with respect to pre industrial levels since this phenomenon has been proven to result in irreversible and potentially catastrophic changes These climate changes are mainly caused by the emissions of greenhouse gases related to human activities and can be drastically reduced by employing energy systems for both heating and cooling of buildings and for power production characterized by high efficiency levels and or based on renewable energy sources This Special Issue published in the journal *Energies* includes 12 contributions from across the world including a wide range of applications such as HT PEMFC district heating systems a thermoelectric generator for industrial waste artificial ground freezing nanofluids and others
