Douglas, Steven G. Krantz, Eric T. Sawyer, Sergei Treil, Brett D. Wick, 2014-08-05 The purpose of the corona workshop was to consider the corona problem in both one and several complex variables both in the context of function theory and harmonic analysis as well as the context of operator theory and functional analysis It was held in June 2012 at the Fields Institute in Toronto and attended by about fifty mathematicians This volume validates and commemorates the workshop and records some of the ideas that were developed within The corona problem dates back to 1941 It has exerted a powerful influence over mathematical analysis for nearly 75 years There is material to help bring people up to speed in the latest ideas of the subject as well as historical material to provide background Particularly noteworthy is a history of the corona problem authored by the five organizers that provides a unique glimpse at how the problem and its many different solutions have developed There has never been a meeting of this kind and there has never been a volume of this kind Mathematicians both veterans and newcomers will benefit from reading this book This volume makes a unique contribution to the analysis literature and will be a valuable part of the canon for many years to come *Topics in Operator Theory* Joseph A. Ball, Vladimir Bolotnikov, J. William Helton, Leiba Rodman, Ilya M. Spitkovsky, 2011-02-09 This is the first volume of a collection of original and review articles on recent advances and new directions in a multifaceted and interconnected area of mathematics and its applications It encompasses many topics in theoretical developments in operator theory and its diverse applications in applied mathematics physics engineering and other disciplines The purpose is to bring in one volume many important original results of cutting edge research as well as authoritative review of recent achievements challenges and future directions in the area of operator theory and its applications **Mathematical Reviews**, 2008 **Algebraic and Geometric Methods in Nonlinear Control Theory** M. Fliess, Michiel Hazewinkel, 2012-12-06 Approach your problems from the right end It isn't that they can't see the solution It is and begin with the answers Then one day that they can't see the problem perhaps you will find the final question G K Chesterton The Scandal of Father The Hermit Clad in Crane Feathers in R Brown The point of a Pin van Gulik's The Chinese Maze Murders Growing specialization and diversification have brought a host of monographs and textbooks on increasingly specialized topics However the tree of knowledge of mathematics and related fields does not grow only by putting forth new branches It also happens quite often in fact that branches which were thought to be completely disparate are suddenly seen to be related

Further the kind and level of sophistication of mathematics applied in various sciences has changed drastically in recent years measure theory is used non trivially in regional and theoretical economics algebraic geometry interacts with physics the Minkowski lemma coding theory and the structure of water meet one another in packing and covering theory quantum fields crystal defects and mathematical programming profit from homotopy theory Lie algebras are relevant to filtering and prediction and electrical engineering can use Stein spaces And in addition to this there are such new emerging subdisciplines as experimental mathematics CFD completely integrable systems chaos synergetics and large scale order which are almost impossible to fit into the existing classification schemes They draw upon widely different sections of mathematics
