

Mathematical Induction

The principle of mathematical induction is a method for proving that a statement $P(n)$ is true for all natural numbers n . It consists of two steps: the base case and the inductive step. The base case is where we prove that $P(1)$ is true. The inductive step is where we prove that if $P(k)$ is true for some natural number k , then $P(k+1)$ is also true. Once these two steps are completed, we can conclude that $P(n)$ is true for all natural numbers n .

For example, let's prove that the sum of the first n natural numbers is $\frac{n(n+1)}{2}$. The base case is when $n=1$, the sum is 1, and $\frac{1(1+1)}{2} = 1$, so the statement is true. For the inductive step, assume the statement is true for k , so the sum of the first k natural numbers is $\frac{k(k+1)}{2}$. Then the sum of the first $k+1$ natural numbers is $\frac{k(k+1)}{2} + (k+1) = \frac{k(k+1) + 2(k+1)}{2} = \frac{(k+1)(k+2)}{2}$, which is the formula for $k+1$. Therefore, the statement is true for all natural numbers n .

Mathematical induction is a powerful tool for proving statements about natural numbers. It is often used in number theory, algebra, and combinatorics. The key to using induction is to clearly state the statement you want to prove and then carefully work through the base case and inductive step.

There are several variations of mathematical induction, including strong induction and transfinite induction. Strong induction is a variation where the inductive step assumes that the statement is true for all natural numbers less than $k+1$, not just for k . Transfinite induction is a variation where the statement is proved for all ordinals, not just natural numbers.
