Subcommittee on Agriculture, Rural Development, Food and Drug Administration, and Related Agencies,2008 *Linking Ecosystem Function to Microbial Diversity* Anne E. Bernhard,John J. Kelly,2016-10-20

Understanding the link between microbial diversity and ecosystem processes is a fundamental goal of microbial ecologists yet we still have a rudimentary knowledge of how changes in diversity affect nutrient cycling and energy transfer in ecosystems Due to the complexity of the problem many published studies on this topic have been conducted in artificial or manipulated systems Although researchers have begun to expose some possible mechanisms using these approaches most have not yet been able to produce conclusive results that relate directly to natural systems The few studies that have explored the link between diversity and activity in natural systems have typically focused on specific nutrient cycles or processes such as nitrification denitrification and organic carbon degradation pathways and the microbes that mediate them What we have learned from these studies is that there are often strong associations between the physical and chemical features of the environment the composition of the microbial communities and their activities but the rules that govern these associations have not been fully elucidated These earlier studies of microbial diversity and processes in natural systems provide a framework for additional studies to broaden our understanding of the role of microbial diversity in ecosystem function The problem is complex but with recent advances in sequencing technology omics and in situ measurements of ecosystem processes and their applications to microbial communities making direct connections between ecosystem function and microbial diversity seems more tractable than ever Disturbance and Ecosystems H. A. Mooney,M. Godron,2012-12-06

The earth's landscapes are being increasingly impacted by the activities of man. Unfortunately, we do not have a full understanding of the consequences of these disturbances on the earth's productive capacity. This problem was addressed by a group of French and U.S. ecologists who are specialists at levels of integration extending from genetics to the biosphere at a meeting at Stanford, California, sponsored by the National Science Foundation and the Centre National de la Recherche Scientifique. With a few important exceptions, it was found at this meeting that most man-induced disturbances of ecosystems can be viewed as large-scale patterns of disturbances that have occurred generally on a small scale in ecosystems through evolutionary time. Man has induced dramatic large-scale changes in the environment which must be viewed at the biosphere level. Acid deposition and CO₂ increase are two examples of the consequences of man's increased utilization of fossil fuels. It is a matter of considerable concern that we cannot yet fully predict the ecological consequences of these environmental changes. Such problems must be addressed at the international level, yet substantive mechanisms to do this are not available.

Government Reports Annual Index, 1975 **Climate Change and Microbiome Dynamics** Javid Ahmad

Parray, 2023-01-01. The book provides an overview relevant to various biological mechanisms that regulate carbon exchanges between the major components and their response to climate change. Climate change has a significant impact on people's lives, energy demand, food security, etc. The soil microbial ecology is vital for assessing terrestrial and aquatic carbon cycles and climate feedback. However, the primary concern is the complexity of the soil microbial community and its severely affected functions due to the climate and other global changes. Global warming comprises an assessment of the dynamic interactions and feedback between microbes, plants, and their physical environment due to climate change. The book will address the need to use a multifactor experimental approach to understand how soil microorganisms and their activities adapt to climate change and the implications of carbon cycle feedback. The most pressing concern is a clearer understanding of the biological factors that regulate carbon exchanges between land, oceans, and the atmosphere and how these exchanges will respond to climate change via climate ecosystem feedbacks which could augment or quell regional and global climate change. Terrestrial ecosystems play an important role in climate feedback as they produce and absorb greenhouse gases like carbon dioxide, methane, and nitrous oxides. They also strongly contribute to storing enormous amounts of carbon in living vegetation and soils, rendering them a significant global carbon sink. If climate change projections are realistic, such a rapid increase in carbon loss from soil could exacerbate the soil carbon cycle feedback. The book will determine the role of microbial feedback in regulating soil-land-atmosphere carbon exchange under changing climatic conditions at the regional and global levels. The current book will also focus on recent research designed to use beneficial microbes such as plant growth-promoting microorganisms, fungi, endophytic microbes, and others to improve understanding of the interaction and their potential role in promoting advanced management for sustainable agricultural solutions. Understanding the influence on

the native microbiome such as the distribution of methanogens and methanotrophs nutritional content microbial biomass and other factors is becoming increasingly crucial to establishing climate resilient agriculture
