10 Ghz Transmitter Circuit:

High-speed Circuits for Lightwave Communications Keh-Chung Wang, 1999 High speed circuits are crucial for increasing the bandwidth of transmission and switching of voice video data over optical fiber networks The ever increasing demand for bit rates higher than those available due to the explosion of Internet traffic has driven engineers to develop integrated circuits of performance approaching 100 Gb/s Commercial lightwave products using high speed circuits of 10 Gb/s and beyond are readily available High Speed Circuits for Lightwave Communications presents the latest information on circuit design measured results applications and product development It covers electronic and optoelectronic circuits for transmission receiving and cross point switching These circuits were implemented with various state of the art IC technologies including Si BJT GaAs MESFET HEMT HBT as well as InP HEMT and HBT The book written by more than 50 experts will benefit graduate students researchers and engineers who are interested in or work in this exciting and challenging field of optical communications

High-Speed CMOS Circuits for Optical Receivers Jafar Savoj, Behzad Razavi, 2007-05-08 With the exponential growth of the number of Internet nodes the volume of the data transported on the backbone has increased with the same trend The load of the global Internet backbone will soon increase to tens of terabits per second This indicates that the backbone bandwidth requirements will increase by a factor of 50 to 100 every seven years Transportation of such high volumes of data requires suitable media with low loss and high bandwidth Among the available transmission media optical fibers achieve the best performance in terms of loss and bandwidth High speed data can be transported over hundreds of kilometers of single mode fiber without significant loss in signal integrity These fibers progressively benefit from reduction of cost and improvement of performance Meanwhile the electronic interfaces used in an optical network are not capable of exploiting the ultimate bandwidth of the fiber limiting the throughput of the network Different solutions at both the system and the circuit levels have been proposed to increase the data rate of the backbone System level solutions are based on the utilization of wave division multiplexing WDM using different colors of light to transmit several sequences simultaneously In parallel with that a great deal of effort has been put into increasing the operating rate of the electronic transceivers using highly developed fabrication processes and novel circuit techniques
